

2nd meeting of the Carbon Removals Expert Group

Carbon Farming: mapping of certification methodologies

21-22 June, Brussels

Welcome and Introduction

Asger Olesen

Review existing Carbon Farming certification methodologies – Forestry

Carbon Farming meeting 22 June
2023

Sven van Baren (WUR)

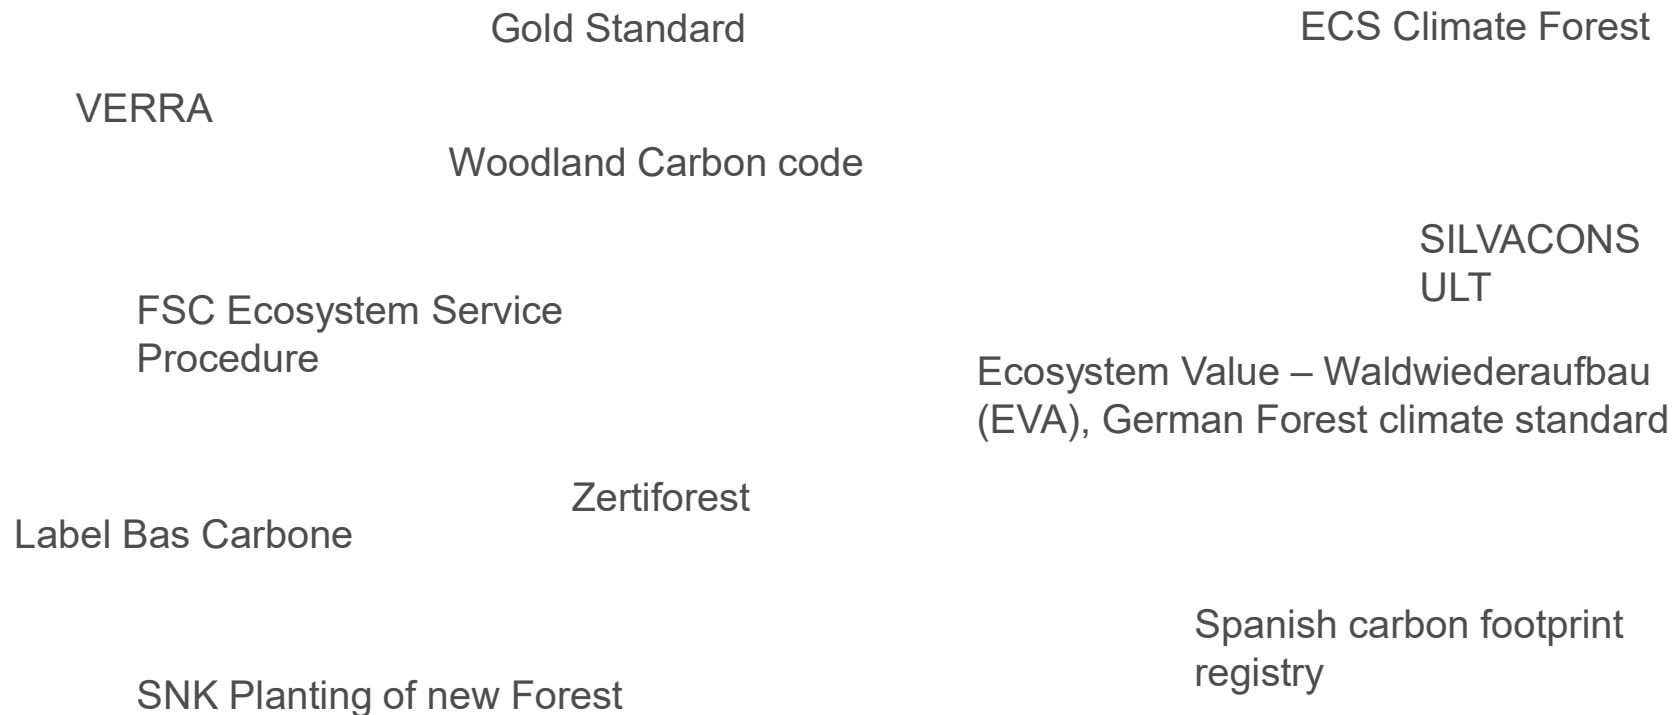

Results of survey for forestry

- 24 responses
- 20 individual methodologies
 - 8 international focus
 - 12 national focus (10 countries)
- 11 methodologies assessed on QU.A.L.ITY criteria

Overview of assessed methodologies

QUANTIFICATION - Approach

Approaches for quantification of forest (carbon) stock

1. Literature or yield tables
2. Inventories over time
3. Remote sensing
4. Combination of techniques

Best practice would be combination of approaches (model, sampling and remote sensing) (IPCC guidelines)

QUANTIFICATION - Baseline

- Most baselines are project based
 - Literature / models / yield tables
 - Measurements (field/RS)
- Most reevaluate baseline after few year

Additionality

- Both regulatory and financial additionality are addressed in most methodologies
- Most methodologies ensure the project is not common practice
- Some require specific (transparent) reporting of additionality

Long-term storage

- Certification period varies
- From 30 years to 100 years (after renewal)
- Or management specific
- Most methodologies use buffer approach (10%-25%) and store it in a “bank”
- Mitigation strategies
 - Avoid high fire risk sites
 - Climate resilient trees

Sustainability

- Most methodologies address the no-harm principle
- Most methodologies require reporting of co-benefits or trade offs
- Co-benefits: climate, soil, community, biodiversity or SDG goals

First conclusions

- QU.** • Different quantification approaches are used, combination of model, inventory and remote sensing is recommended
 - Not all methods reevaluate baseline
- A.** • Both regulatory and financial additionality are addressed in most methodologies
- L.** • Certification period varies among methodologies, some depend on specific management strategy
- ITY** • Most methodologies comprise no harm principal, some already report this

Thank you

GIS | Integrating Data for Carbon Certification

Fitting a modern GIS to an innovative policy

- The European Commission is implementing an ambitious policy for harmonized, authoritative carbon certification across the EU
- Modern GIS can host data and analytics as needed, allowing decision makers easy access to data and information, and act as an engine for engaging European citizens
- While the policy context is the first of its kind in the world, the technical challenges are standard for the GIS industry

EU Soil Observatory - dashboard with indicators

The EU Soil Observatory (EUSO) will establish a comprehensive dashboard containing indicators that present data on soil-related issues within and, in some cases, outside of the EU.

The following are examples of indicators in relation to the Common Agricultural Policy (CAP), Agro-environment and Sustainable Development Goals (SDGs):

Soil erosion, soil carbon and soil nutrients (Phosphorus, Nitrogen, Potassium) indicators

The soil erosion, soil carbon and soil nutrients (Phosphorus, Nitrogen, Potassium) indicators provide baselines for evaluating the status of agricultural soils in the EU. They are also used for evaluating the impact of agro-environmental policies on land management.

Common Agricultural Policy (CAP) indicators

Climate Data Dashboard

of the ESA Climate Change Initiative

Above-Ground Biomass

The primary science objective ESA's Climate Change Initiative Biomass project (Biomass_cci) is to provide global maps of above-ground biomass (Mg ha⁻¹) for four epochs (mid 1990s, 2007/2010, 2017/2018 and 2019/2020) these being capable of supporting quantification of biomass change.

Dataset Information
Start date: 01 Jan 2010
End date: 31 Dec 2020
FTP Download
Additional Download Options

This dataset comprises estimates of forest above-ground biomass for the years 2010, 2017, 2018, 2019 and 2020. They are derived from a combination of Earth observation data, depending on the year, from the Copernicus Sentinel-1 Envisat's ASAR instrument and JAXA's Advanced Land Observing Satellite (ALOS-1 and ALOS-2), along with additional information from Earth observation sources. The data has been produced as part of the European Space Agency's Climate Change Initiative (CCI) programme by the Biomass CCI team. This release of the data is version 4. Compared to version 3, version 4 consists of an update of the three maps of AGB for the years 2010, 2017 and 2018 and new maps for 2019 and 2020. New AGB change maps have been created for consecutive years (2010-2017, 2018-2019 and 2020-2019) and for a decadal interval (2020-2010). The pool of remote sensing data now includes multi-temporal

Decision Making

Capabilities continue to advance, and policy priorities develop and change. Geospatial infrastructure ensures that agencies are prepared to adopt improved land classification schemes and support innovations in areas like agricultural data spaces.

In addition, the ability to link data based on location allows for improved support of complementary or synergistic policies. Carbon certification, for example, could potentially involve several of the data spaces seen in the graphic to the right.

Data spaces as part of the European data strategy (Source)

As the carbon certification system is developed, what other policies could it support?

Innovative forms of deployment (1) – Multiple use of space

Multiple use of space can contribute to mitigating land constraints linked to competition for space, including for environmental protection, agriculture and food security.

In particular, under certain conditions, the agricultural use of land can be combined with solar generation in so-called agrivoltaics (or agri-PV). The two activities can establish synergies, whereby PV systems can contribute to crop protection and yield stabilisation³⁶, with agriculture remaining the primary use of the land area. Member States should consider incentives for the development of agri-PV while designing their National Strategic Plans for the Common Agricultural Policy, as well as their support frameworks for solar energy (e.g. through the integration of agri-PV in renewable energy tenders). It is also worth noting that, in the agricultural sector, State aid rules allow investment aid to sustainable energy.

Q&A on presentations

BLOCKCHAIN CERTIFIED CARBON SINK SOLUTIONS

FORESTATION · DIGITALIZATION · MONETIZATION

OUR ORIGINS

Initiated in Finland together with forest owners who want to have a real impact on climate change and who create carbon sinks targeting the maximum efficiency.

OUR TEAM: Seasoned professionals with diverse backgrounds

Panu Tornainen
Managing Director
Co-Founder

20 years of Lean Management experience with 8 years experience as a CEO running over 500mill€ business with factories all over Europe

Henri Syvänen
Sales&Marketing
Co-Founder

Eng, 5 years experience in international sales in Forest industry, tree planting, forest management and GPS based product development

Paco Conde
Business Development
CO-Founder

Civil Eng, MSc, MBA. 35 years of experience in strategy, innovation mgmt and entrepreneurship, corporate communication, project mgmt, venture building and tech-Scouting. Co-founded 6 startups

Victor Serriñana
Operations and Organizational
Development
CO-Founder

Business MSc. 20+years of experience in international General Management positions, including multi-site companies, having led different M&A, business development and business transformation projects. Co-founder of 3 startups

ZERTI CARBON WAS FOUNDED IN 2021

ZertiForest, the Finnish service company and reforestation technology experts (a key members of Risutec) and the Catalan Blockchain Zertifier decided to team up in order to create the most transparent and the greenest way of compensating CO2 emissions. Our unique approach to solving carbon sink challenge and connecting interesting parties in order to reach net-zero policies is based on extensive ZertiForest's forest owning/operating experience combined with the cutting-edge ICT know-how of Zertifier.

Different thinning models

Fertilizing

Fast planting process

Mixed forests

Soil-life under the roots

Biodiversity

DIGITALIZATION

STEP 1

Trees are mapped with drone tailored to forest inventories.

STEP 2

Individual pictures are joined into image mosaic covering the whole project area.

STEP 3

Pictures captured by drone are processed into digital 3D model of forest.

STEP 4

Species, tree height and dbh is measured or estimated for each tree.

STEP 5

Stand borders are delineated according to forest type.

DIGITALIZATION

Ortomosaic d'alta resolució en espectre visible (RGB)

Índex NDVI

ZERTI CARBON

The basic idea behind Zerti Carbon is to provide a comprehensive service of connecting forest owners with clients in need of carbon sink solutions based on blockchain platform. As blockchain itself, our platform is safe and fully transparent - our clients have access to every step of the process - from locating the actual forests to acquiring their NFTs and CO2 tokens (ZCO2). In addition to that, we provide the extensive information about the forest ownership and the value of ZCO2 based on a very precise mathematic formulas that are related to the GPS information of every single tree and its capacity to capture CO2.

ZERTI CARBON CASE STUDY: KULJETUS TAHVO OY

PILOT PROJECTS IN CATALUNYA: SANT CUGAT

PILOT PROJECTS IN CATALUNYA: MANRESA

SUMMARY

Connecting forest owners and companies/individuals/investors

Attractive to forest owner in terms of income

Optimal solution to environment, protecting forests

Promoting/creating new forest areas

A solution that is true, based on the facts

Smarter way to manage forests, respecting the biodiversity

No chance to sell twice

No double counting

Economic solution to operate, no need for a “middleman”

Transparent on each step

Structure

- 10 Principles
- 34 Criteria
- 88 Indicators

▶ 1. Legal Compliance

▶ 2. Project Management

▶ 3. Additionality

▶ 4. Ecological Sustainability

▶ 5. Social Sustainability

▶ 6. Methodologies

▶ 7. Permanence

▶ 8. Certification

▶ 9. Uniqueness

▶ 10. Impact

▼ 3. Additionality	Wald-Klimazertifikate entstehen zusätzlich zum Referenzszenario und ihre Erlöse tragen entscheidend zur Projektumsetzung bei.	4
▼ 3.1 Kriterium - Gesetzliche Additionalität	Die gesetzliche Additionalität ist gegeben, wenn das Projekt in einem Land umgesetzt wird, dessen Pariser Klimaziele zwar größtmöglichen Ambitionen entsprechen, aber in ihrer Umsetzung unter den aktuellen gesetzlichen Rahmenbedingungen (inkl. staatlicher Forderungen) voraussichtlich nicht erreicht werden.	4
▼ 3.2 Kriterium - Finanzielle Additionalität	Das Projekt ist auf die Einnahmen aus den Wald-Klimazertifikaten zur Finanzierung der Projektumsetzung angewiesen.	4
▼ 3.2.1 Indikator - Barrieren-Analyse	Der Projektverantwortliche zeigt durch einen UNFCCC-konformen Barrieretest auf, dass das Projekt auf Einnahmen aus den Wald-Klimazertifikaten zur Finanzierung der Projektumsetzung angewiesen ist.	4
▼ 3.2.2 Indikator - Staatliche Forderung	Der WKS kann sowohl von Waldbesitzern angewandt werden, die staatliche Forderungen in Anspruch nehmen, als auch von Waldbesitzern, die keine staatlichen Forderungen in Anspruch nehmen. Sollten Forderungen mit Erlösen aus Wald-Klimazertifikaten kombiniert werden empfiehlt der WKS den Waldbesitzern mit den zuständigen Behörden zu klären, ob dies die Förderfähigkeit beeinflusst.	4
▼ 3.3 Kriterium - Klimatische Additionalität	Das Projekt generiert eine reale und messbare Klimawirkung, die entsprechend der Grundsätze des IPCC nachvollziehbar quantifiziert, überwacht und transparent berichtet wird.	4

Forest

**Science &
Technology**

**Carbon
Market**

**Public &
Civil society**

- Multi-Stakeholder-Plattform
- > 35 people
- Assisting in the development
- Every 6 months
- Knowledge across entire Supply-Chain
- Many discussion - one common goal

Status quo

- 2 years of development
- full version (after summer 2023)
- 10 pilot projects
50 in pipeline
- **Germany lost > 300'000 ha of forest after drought 2018/19**

Topics of the Day

1. Regulatory Additionality
 2. Ecological & Social Safeguards
 3. Baseline, Project act. & MRV
 4. Permanence
- What do we do differently?
 - 3 wishes to the EU

1. Additionality

- **Regulatory**
- Financial
- Climatic

Regulatory Additionality

Based on legislation or based on science?

- What do I mean with this?
- until 2050 in Germany **95,000 ha/year**
- **transformed to climate resilient forest**
Currently **41,000 ha/year** are transformed
 - existing forest & reforestation

Until legislation and subsidies do not reach this threshold, voluntary standards are additional

2. Ecological & Social Safeguards

Source: <https://www.pinterest.de/pin/reinventing-the-wheel-the-chinese-quest-385831893060415517/>

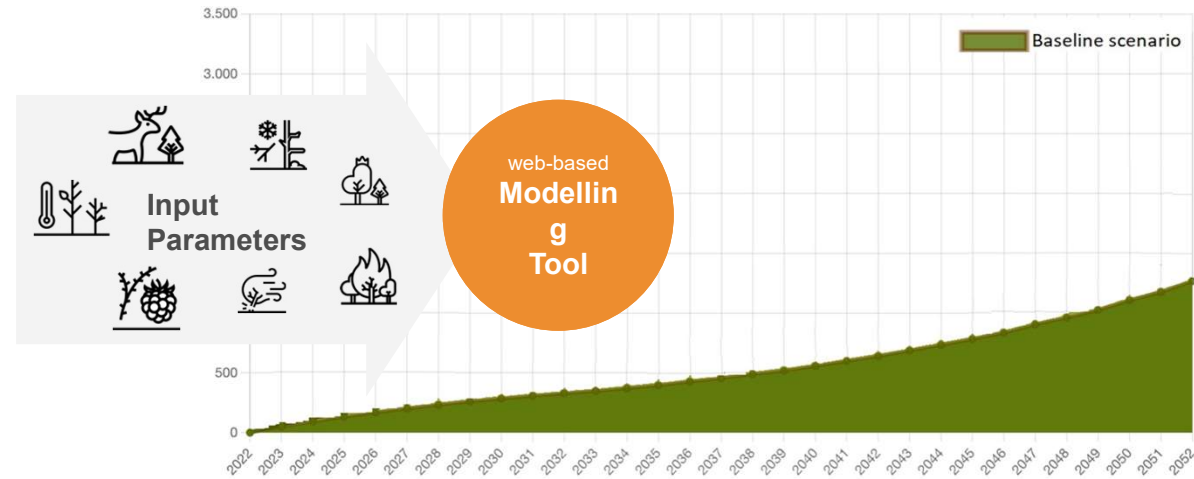

FSC: https://de.wikipedia.org/wiki/Forest_Stewardship_Council
PEFC: https://commons.wikimedia.org/wiki/File:PEFC_Logo.svg

3. Methodology

Baseline

- Natural regeneration
- How well protected is the forest?
- How resilient are the tree species?
- How strong is the competitive veg.?

- by project developer - site specific
- science based ^{verified by auditor}
- updated min. every 3 years

3. Methodology

Project scenario

- Minimum 3 climate resilient species
- Science-based lists:
Which and what combination?

Δ = additional
Carbon sequestration

3. Methodology

MRV

- All projects at once
- Analysis of 3-5 years
- Remote Sensing and LiDAR
- Smallest unit: 0.5 ha
- Most cost-efficient

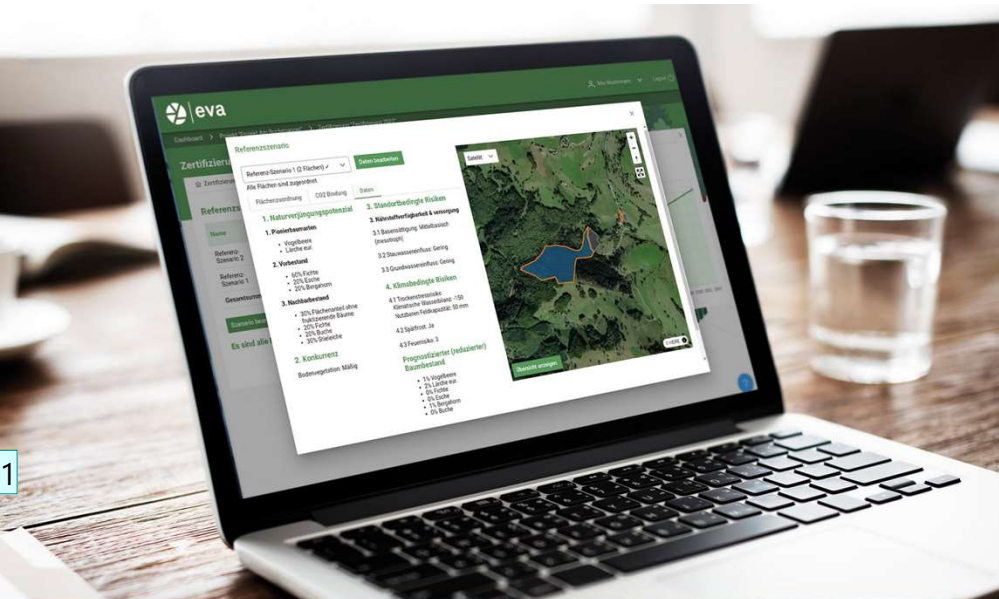

4. Permanence

Fixed Puffer

- all projects
- 15%
- AFOLU Non-Permanence Risk Tool
- New methodology = reassessment
- Buffer for shortfalls of
 - unavoidable risks
 - modelling
- Avoidable risks
 - by project developer

- Crediting Period: 20-30 years
- Monitoring entire 100 years (juridical question)

What do we do differently?

- High level on digitalization
- Cost efficient - at small projects sizes
- Audits with tablet/smartphone in the forest
- PDD + certif. report is created automatically
- Less than 4 months

Slide 58

GOBIERNO
DE ESPAÑA

MINISTERIO
PARA LA TRANSICIÓN ECOLÓGICA
Y EL RETO DEMOGRÁFICO

Spanish Registry of carbon footprint, carbon removal projects and offsetting

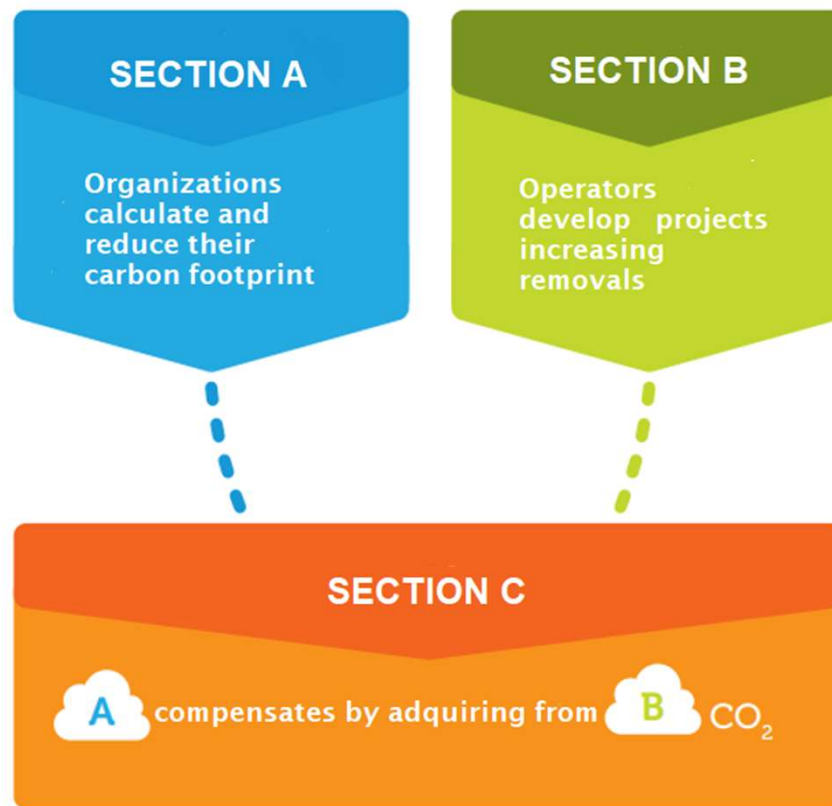

Iván Martínez
Expert Group on Carbon Removals
June 22nd 2023

What is it?

- ❖ *Voluntary tool*
- ❖ *Legal basis; Royal decree 163/2014 (modification in progress) + complementary documents*

Section B: Carbon removal projects

❖ *2 methodologies until now (more under development):*

Land converted to Forest Land

Restoration of burned forest land

General requirements

- ❖ *Minimum 1 ha (FL definition)*
- ❖ *Minimum monitoring period 30 years (commitment to keep the forest in good condition)*
- ❖ *No limitations for activity period (usually much longer)*
- ❖ *Mandatory management plan, with a schedule of activities + Monitoring every 5 years at least*
- ❖ *Monitoring reports can be made by any professional with proven knowledge, independent to the project and unrelated to all parts (template under development)*
- ❖ *Description of other benefits*

Quantification

- ❖ Only CO₂ attributed to CSC in living biomass (baseline=0)

ANNUAL CHANGE IN CARBON STOCKS IN LIVING BIOMASS IN FOREST LAND REMAINING FOREST LAND (STOCK CHANGE METHOD)

$$\Delta C_{FF_{LB}} = (C_{t_2} - C_{t_1}) / (t_2 - t_1)$$

and

$$C = [V \bullet D \bullet BEF_2] \bullet (1 + R) \bullet CF$$

- ❖ Ex-ante calculations (data from National forest inventory) + ex-post (measured data from monitoring reports)

2. CALCULADORA DE ABSORCIONES EX ANTE DE CO₂ DE LAS ESPECIES FORESTALES ARBÓREAS ESPAÑOLAS

Se distinguen dos metodologías de cálculo en función del tipo de repoblación realizada. En los casos en que el fin de la repoblación no sea productivo o bien, que el turno de corta previsto sea superior al periodo de permanencia, se escogerá la Opción A (Repoblaciones sin aprovechamiento maderero o de aprovechamiento no intensivo). En caso de tratarse de repoblaciones de aprovechamiento intensivo cuyo turno de corta sea inferior al periodo de permanencia, se escogerá la Opción B (Repoblaciones de aprovechamiento intensivo, cortas a hecho).

Opción A. Repoblaciones sin aprovechamiento maderero o de aprovechamiento no intensivo.

Estimación de las absorciones generadas por todas las plantaciones realizadas desde el año de inicio del proyecto hasta el término del periodo de permanencia referido a dicho año.

Especie	Año plant.	Nº pies objetivo	Absorciones	
			100%je	10%
Pinus alba				
Pinus uncinata				
Quercus ilex				
Quercus robur				
Pinus nigra				
Pinus sylvestris				
Pinus sp.				
Pinus sp.				

Ejemplo: Proyecto engloba dos plantaciones, una que se realiza en 2020, y otra en 2022 y acredita una permanencia de 30 años. Deben tenerse en cuenta las siguientes consideraciones:

- La permanencia abarca los 30 años desde el año de inicio del proyecto (2020), hasta el año 2050. No obstante, debe acreditarse que la plantación realizada en 2022 también cumplirá una permanencia mínima de 30 años (la segunda plantación permanecerá, al menos, hasta el año 2052).
- La repoblación de maderas no debe considerarse como una nueva plantación. El dato de "Nº pies objetivo" transcurrido el periodo de permanencia debe estimarse considerando posibles repoblaciones, tasas de mortalidad y las cortas previstas en el plan de gestión.
- Los cálculos se realizarán estimando las absorciones que se generarán en el año 2050 (habrán transcurrido 30 años para la plantación de 2020, y 28 años para la de 2022).

Alto

1. Contenido e instrucciones | 2. Datos generales proyecto | 3. Estimación absorción total | 4. Absorciones Disponibles | 5. Factores de absorción | 6. Estimaciones de ... | 7. | 8. | 9. | 10. |

Liability mechanisms

- ❖ *Guarantee fund: feed with 10% of every certified removal within the scheme*
- ❖ *The fund restores already used tonnes of CO2 that disappear due to force majeure (forest fires, pests, etc.)*
- ❖ *Area linked to disappeared removals shall be restored*
- ❖ *Approach to ensure no-harm to other environment objectives from current legislation*

PROYECTOS DE ABSORCIÓN Definiciones

❖ Operators declare that removals will not be used in any other scheme. Also acknowledgment that removals will be accounted under Spanish GHG inventory is required.

Current state

Total projects	Total area (ha)	Foreseen removals (t CO ₂)	Utilised removals (t CO ₂)	Available removals (t CO ₂)	Guarantee fund (t CO ₂)
452	8.687	3.777.301	39.895	647.201	68.689

Number of projects

Area

Ongoing modifications, future challenges

- ❖ *New activities/methodologies under assessment: specific forest management practices, agricultural practices, wetlands, marine environment*
- ❖ *Consideration of other carbon pools*
- ❖ *More transparency: publicity of documents, visualization tool/web*
- ❖ *Harmonization of monitoring reports and information on other objectives (adaptation, biodiversity, disaster risk reduction, socioeconomic aspects...)*

THE FOREST STEWARDSHIP COUNCIL® ECOSYSTEM SERVICE PROCEDURE (FSC PRO 30 006)

Anne Van Der Bruggen, Wesley Snell

**FORESTS
FOR ALL
FOREVER**

Content

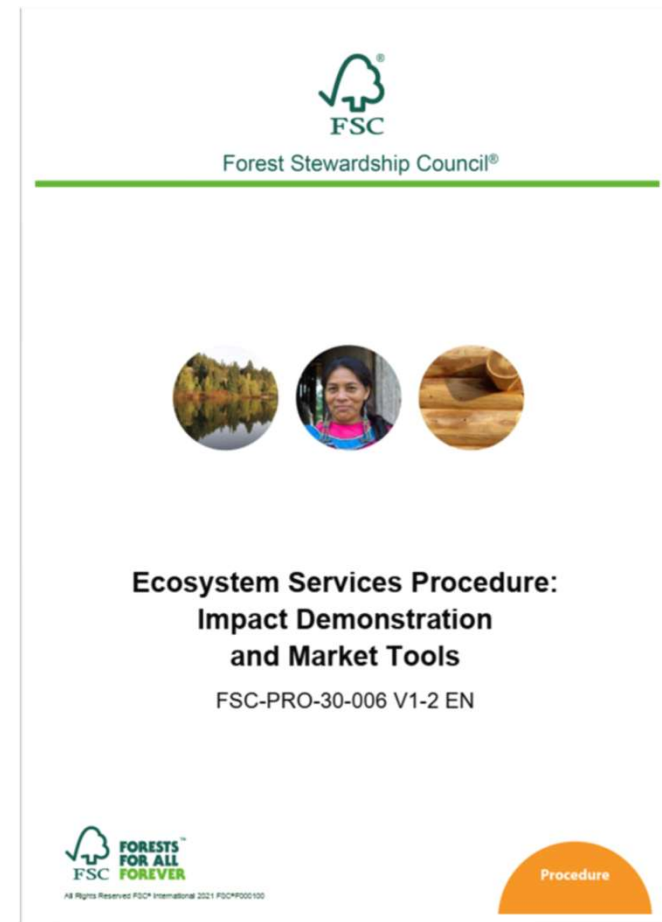

1. The FSC Ecosystem Services Procedure
2. Alignment with CRC QU.A.L.ITY criteria
3. Case studies

An aerial photograph of a dense, lush green forest. The trees are tightly packed, creating a textured canopy of various shades of green. In the upper center, a small, irregularly shaped pond or clearing is visible, reflecting the sky. The overall scene conveys a sense of a healthy, managed natural ecosystem.

THE FSC ECOSYSTEM SERVICE PROCEDURE FSC PRO 30 006

Overview

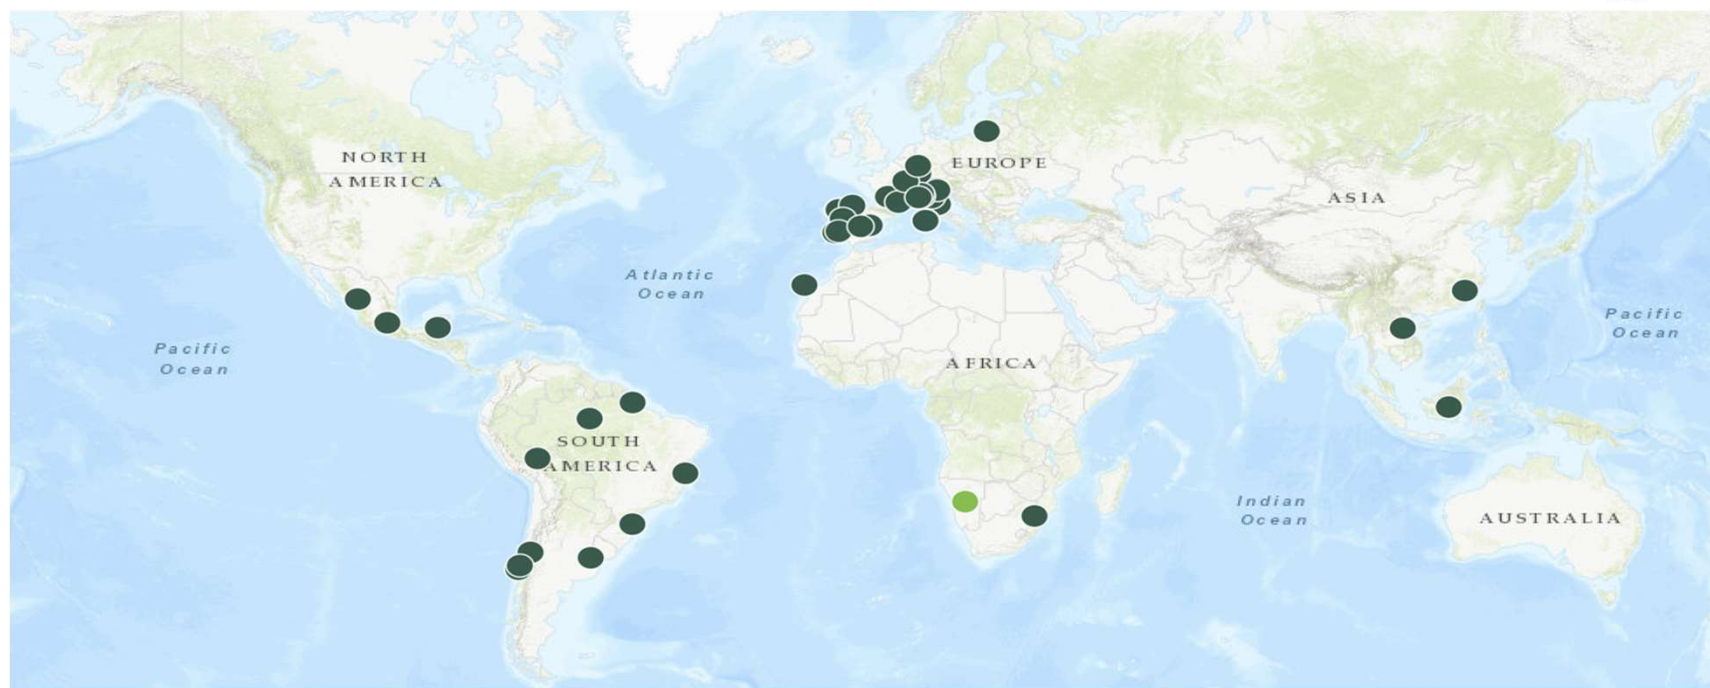

- **Impact demonstration framework** that verifies the positive impacts of forest management activities on five ecosystem services
- The procedure sets **quality thresholds and reporting requirements** that allow outcome indicators and methodologies suitable for the local context
- Reduces risk of unintended consequences through **stringent social and environmental do-no-harm safeguards**
- Produces **quantified, externally verified, annually audited impact claims** that allow forest managers to access markets for ecosystem services

European
Commission

Background and Context

Source: FSC website, 2021

- >50 forest managers have applied the procedure all over the world
- >2.2 million hectares verified for positive impacts on carbon and other ecosystem services
- Widely applied in EU (Italy, France, Spain, Portugal, Germany, and more)

European
Commission

Scope of Ecosystem Services and Impacts

Code	Ecosystem Service	Impact
ES1	Biodiversity Conservation	1.1 Restoration of natural forest cover 1.2 Conservation of intact forest landscapes 1.3 Maintenance of ecologically sufficient conservation area networks 1.4 Conservation of natural forest characteristics 1.5 Restoration of natural forest characteristics 1.6 Conservation of species diversity 1.7 Restoration of species diversity
ES2	Carbon Sequestration and Storage	2.1 Conservation of forest carbon stocks 2.2 Restoration of forest carbon stocks
ES3	Watershed Services	3.1 Maintenance of water quality 3.2 Enhancement of water quality 3.3 Maintenance of the capacity of watersheds to purify and regulate water flow 3.4 Restoration of the capacity of watersheds to purify and regulate water flow
ES4	Soil Conservation	4.1 Maintenance of soil condition 4.2 Restoration/enhancement of soil condition 4.3 Reduction of soil erosion through reforestation/restoration
ES5	Recreational Services	5.1 Maintenance/conservation of areas of importance for recreation and/or tourism 5.2 Restoration or enhancement of areas of Importance for recreation and/or tourism 5.3 Maintenance/conservation of populations of species of interest for nature-based tourism 5.4 Restoration or enhancement of populations of species of interest for nature-based tourism
ES6	*Cultural Services* (v2 2024)	6.1 Maintenance of cultural practices 6.2 Enhancement of cultural practices 6.3 Maintenance of culturally valued species or populations 6.4 Enhancement of culturally valued species or populations

CASE STUDIES

Smallholder Forest Group in Italy

- Gruppo Foreste Sostenibili di Etifor is composed of **>30 smallholders and conservation forests**
- **>3,000 hectares** with verified positive impacts for **carbon, biodiversity, water, soil, and recreational services**
- **Works for all forest types** – large, small, public, private, productive, conservation-oriented
- **Includes blended finance models** with public and private contributions (see our BIOCLIMA initiative)

Utilities of the ES PRO for different actors in Sweden

Swedish forestry

Two different niches:

- Large forest owners
- Communities / organisations

Main reasons using the ES PRO

- Business and market demand
- Communicating impacts

Thank you

Review existing Carbon Farming certification methodologies – Peatland

**Expert Group Carbon Removals
Carbon Farming meeting 22 June 2023**

Jasmijn Sybenga (Partners for Innovation / CRETA)

Results of survey for PEATLAND

- 6 responses
- 4 individual certification methodologies
 - 4 operational certification methods, 2 (pilot) projects aimed at optimising sequestration capacity / implementation of innovative climate change mitigation measures
 - 3 international focus
 - 3 national focus (3 countries: DE, NL, UK)
- 6 methodologies assessed on Q.U.A.L.I.T.Y criteria

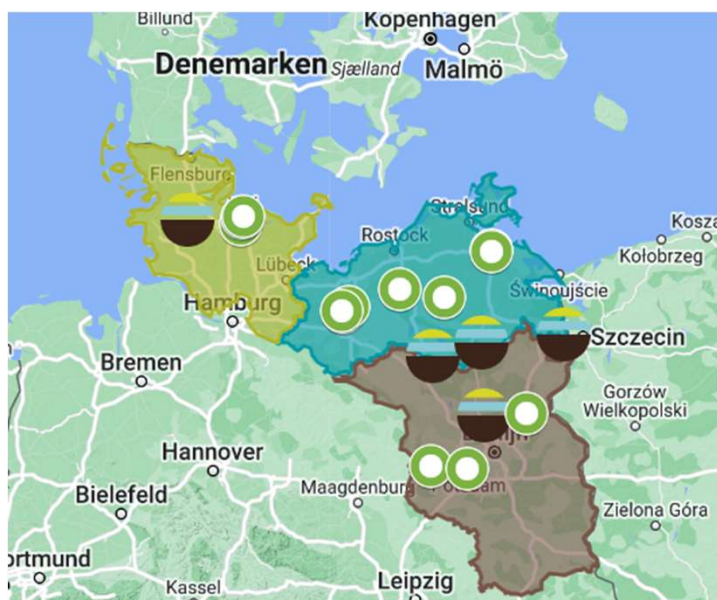

Overview of assessed methodologies

Short name	Country/ Geographical focus	Validated against standard:	Eligible practice(s)
Provided by EU Survey respondents:			
MoorFutures	DE	ISO 14064, VERRA VM0036	Rewetting of drained peatlands reduces emissions of greenhouse gases (GHG). MoorFutures are carbon credits that map these emission reductions. Net carbon removal by new peat accumulation is also possible, but at much smaller scale and conservatively not yet included in the credit.
Wetlands4climate	Int	No	Carbon components considered are soil, aboveground and belowground biomass, and optionally deadwood and litter. GHG considered are CO ₂ , CH ₄ , and N ₂ O.
LIFE OrgBalt	Int	No	Paludiculture; Semi-natural regeneration; Agroforestry; fast growing species in riparian buffer zones; Conversion of cropland used for cereal production into grassland; legumes in conventional farm crop rotation; Strip harvesting in pine stands; Forest regeneration (coniferous trees) without reconstruction of drainage systems; Continuous cover forestry on peatland; Shifting to continuous cover forestry on peatland. GHGs: CH ₄ , N ₂ O, CO ₂
SNK Currency for Peat	NL	SNK	Specific practices: restoration, management of vegetation, management of soil, management of water (like re-flooding)
ECS KlimaMoor	Int	ISO 14064 (by end 2023)	<ul style="list-style-type: none"> Rewetting projects, improvement of the water balance GHGs eligible for certification: CO₂ and CH₄
Added from other sources:			
UK Peatland Code	Int	ISO/IEC 14065 and EA-1/22 Peatland Code v1.2 (v2.0 under review)	Restoration of blanket bog or raised bog with an associated baseline condition of: actively eroding, draining, modified bog, drained cropland, in- and extensive grassland. Fens with an associated baseline condition of drained cropland, in- and extensive grassland and modified fen. GHG emissions used in the calculation of emissions factors include carbon dioxide (CO ₂), methane (CH ₄), nitrous oxide (N ₂ O), dissolved organic carbon (DOC) and particulate organic carbon (POC).

Uptake

- MoorFutures

- Peatland Code

Total number of Peatland Code projects	197
Number of projects registered and under development	166
Number of validated projects	31
Total Area of Peatland	26,855 ha
Average project size (for validated projects)	145 ha
Average project duration (for validated projects)	82 years
Projected emissions reduction as total number of validated, claimable Pending Issuance Units* (PIUs)	1,007,103 tonnes of CO ₂ e
* 1 PIU = 1 tonne of Carbon Dioxide equivalents	

June 2023

QUANTIFICATION

Approaches:

- Most certification methodologies do not explicitly distinguish between the avoided release of carbon and the actual removals of carbon: Peatland Code and SNK, MoorFutures (in latter not yet in credit)
- GEST approach applied by MoorFutures / VERRA VM0036
- Addressing uncertainties: underestimation (KlimaMoor), buffer (MoorFutures, Peatland Code), project specific uncertainty/risk assessment (SNK)

Baseline:

- Baselines are in all cases (mostly) project based
- SNK includes standardised elements (water tables fixed in regulations)

Additionality and Long-term storage

Additionality:

- Regulatory as well as financial additionality addressed in KlimaMoor and Peatland Code, latter provides detailed requirements in series of additionality tests

Long-term storage:

- Certification periods of min. 30 years, in most cases up to 50 years (exception: SNK for particular case of maintaining agricultural function)
- Remote Sensing – not applied, not yet available at required level of accuracy

Sustainability

- All methodologies include a type of 'environmental no harm' mechanism. In some cases, the peatland restoration is planned with opinions of external stakeholders and experts
- Co-benefits are mentioned, but in most cases not monitored (exception: MoorFutures ecosystem services)

First conclusions

- QU.** • All methodologies use project-based baselines, broadly applicable standardised baseline are so far not available.
 - Indirect emissions are not in all cases taken into account – approaches vary in this respect.
- A.** • Both regulatory and financial additionality are addressed in the mostly used certification methodologies, detailed assessment methods available.
- L.** • Certification periods of 30 years, extendable to 50 years are possible in most cases. Various approaches available to mitigate the risk of release.
- ITY** • All methodologies comprise no harm principal (and require this to be documented), valuation of co-benefits incl. biodiversity so far limited.

Thank you for your attention!
Questions?

j.sybenga@partnersforinnovation.com

Q&A on overview

PEATLAND CODE

Dr Renée Kerkvliet-Hermans

Peatland Code coordinator, IUCN UK Peatland Programme

Peatland Programme Vision

The IUCN UK Peatland Programme has a vision for healthy, wildlife-rich peatlands in the UK, that provide multiple benefits for people.

VALUED PEATLANDS

The value of our peatlands is better understood and prioritised for restoration and conservation.

STRONG PARTNERSHIPS

Bring together scientists, practitioners, land managers and policy makers and all those who can help to deliver strategic peatland goals.

ACTION THROUGH KNOWLEDGE EXCHANGE

Provide guidance and promote good practice for peatland management that is underpinned by scientific consensus and monitoring, and is responsive to new evidence.

Funding gap

Almost 3million ha of peatland (as currently mapped) in the UK (2,962,622ha) –estimates c.80% in damaged state (IUCN- State of UK Peatlands, 2020)

ONS estimates £8-22 billion restoration costs but realised benefits of £45-51billion over the next 100 years (ONS UK natural capital: peatlands, 2019)

Public funding gap of £560 million to restore the UK's degraded peatland (GFI, eftec, & Rayment Consulting, 2021)

Peatland Code

A UK govt-backed, domestic voluntary carbon market standard

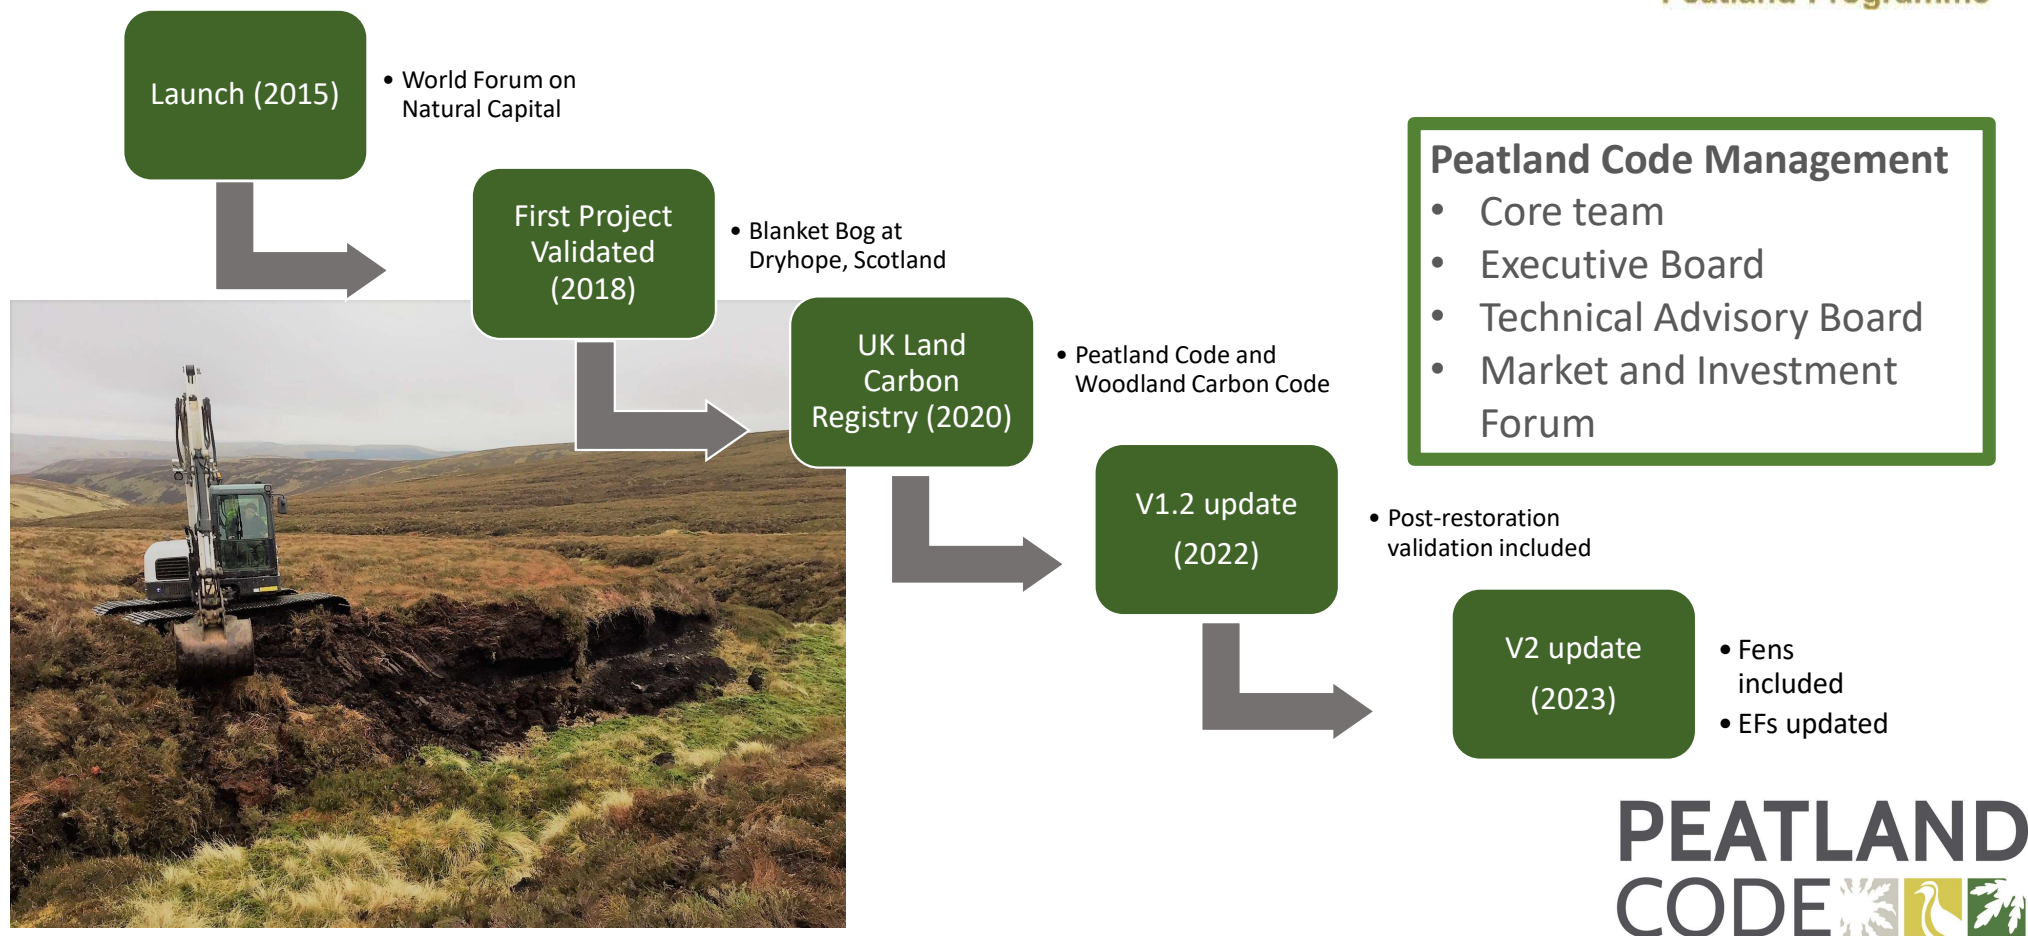

that...

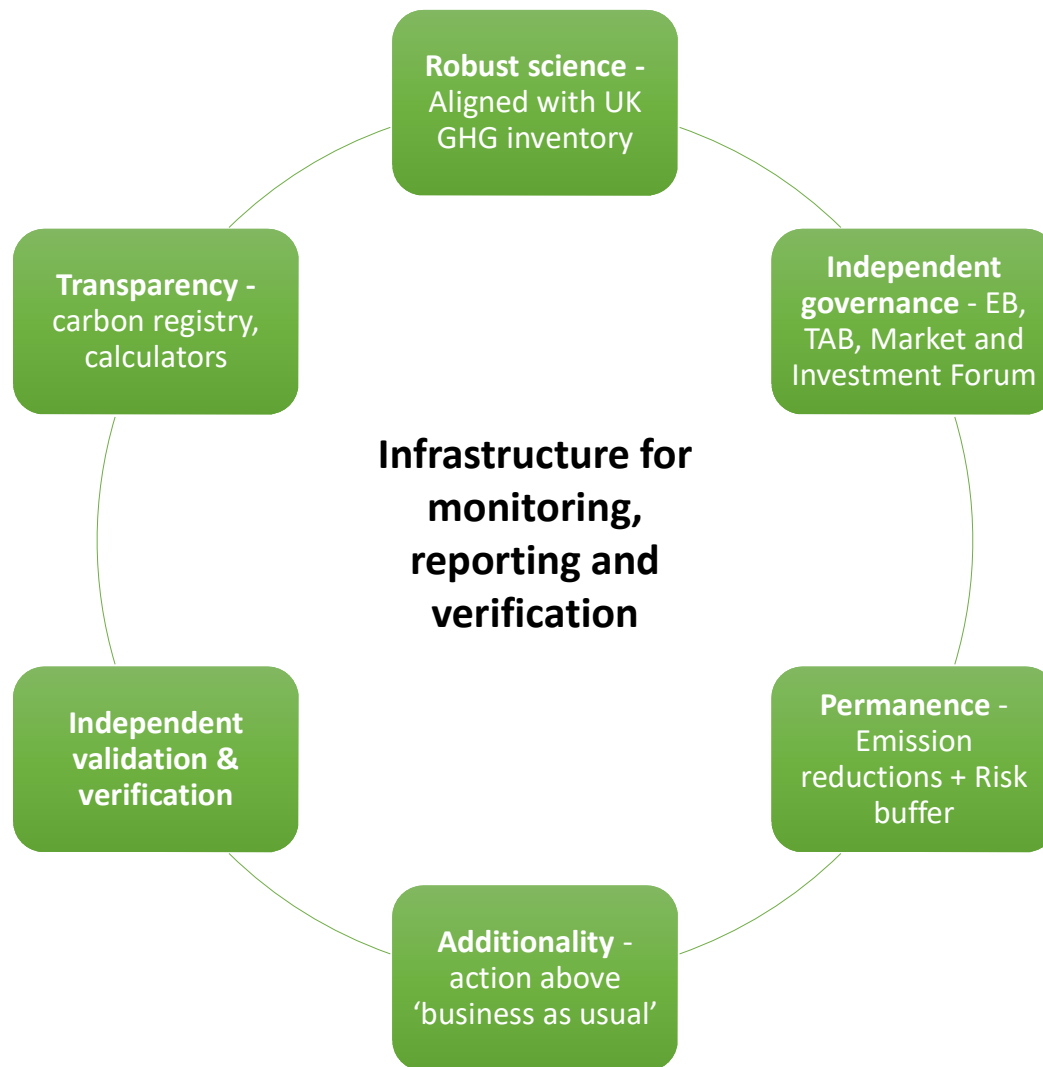

landowners with eligible damaged peat can follow to attract private finance for peatland restoration by selling carbon units.

PC's purpose is to underpin market trust and confidence

Peatland Code Development

Buyer confidence

Government-backed:

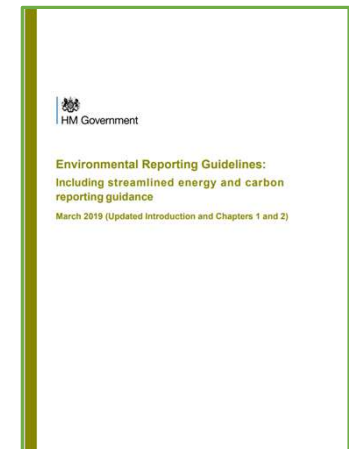

- Governments Net Zero Strategy
- Defra's 25 year Environment Plan
- Scotland's Climate Change Plan

UK Govt: Environmental Reporting Guidelines

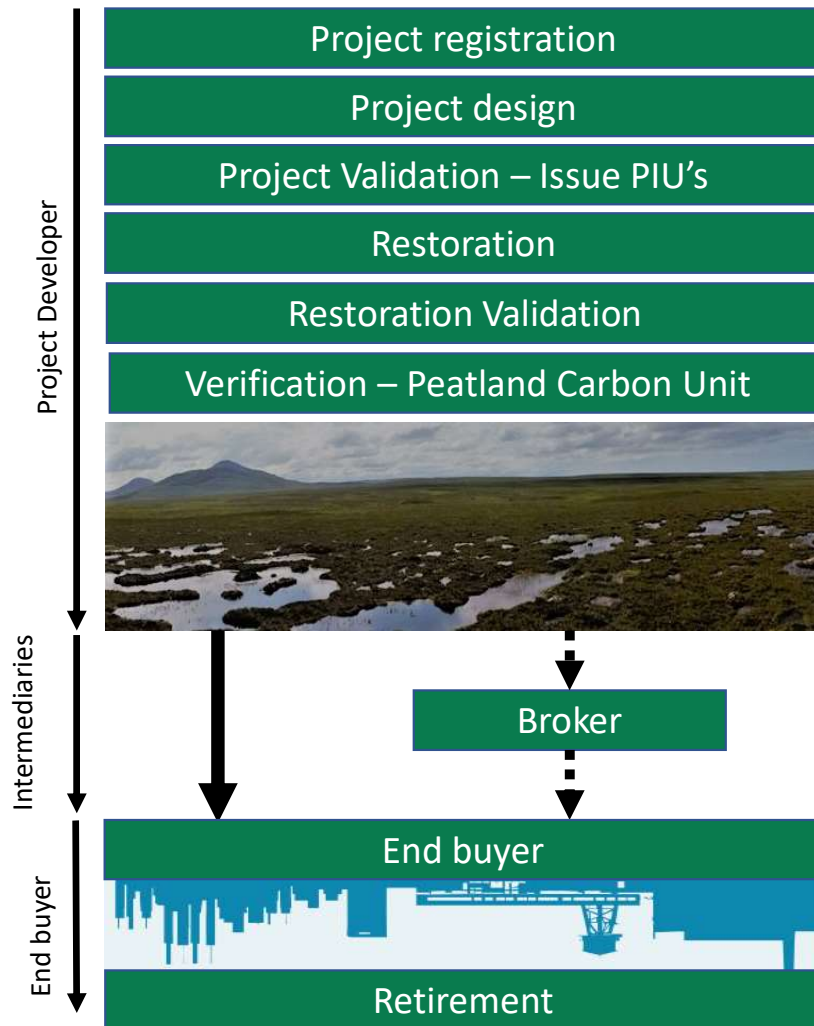

- 12,000 large companies mandated to report emissions
- Can use Peatland Carbon units

Transparent registry

- UK land carbon registry on IHS Markit

Greifswald University

SNK – certificates for voluntary climate action

Wytze van der Gaast

secretariaat@NationaleCO2markt.nl

22 June 2023

- 2017 – Green Deal ‘Nationale Koolstofmarkt’
- 2019 – Stichting Nationale Koolstofmarkt established
- Focus on GHG emission reduction or carbon removal options that are not yet addressed by government policy
- Rulebook
 - Methods to calculate emission reductions or carbon removals
 - Rules for additionality and use of certificates
 - Check & double check

How it started

Basic market structure

What is the value of a certificate?

- An SNK certificate is token that a project:
 - Reduced/removed GHG emissions, which is
 - Additional to existing and planned policies, and
 - Validated / verified by independent experts.
- Recognition of reduction/removal as a product or service.
- The buyer can demonstrate voluntary investment in a domestic climate action project.
- The buyer cannot use the certificate for compliance with own climate obligations -> emission reduction/removal remain with sector of the project

List of SNK methods

(<https://nationaleco2markt.nl/methoden/>)

Peat rewetting	Rewetting peat(y) soils by increasing groundwater level in peat/wetlands
Aqua- & riothermie	Use thermal energy from surface and wastewater
Greenswitch	Removal of ammonium nitrate from animal manure and conversion into high value liquid nitrate fertilizer of organic origin (avoiding use of chemical fertilizers)
Cow credits	Feed additives to reduce cattle methane emissions
Improve tyre pressure of cars	Smart tyre pump for higher tire pressure and fuel savings of passenger vehicles
Trees-outside-forests	Afforestation in trees outside forest concepts, like agroforestry
Climate smart forest management	Climate smart forest management
Permanent grasslands	Carbon sequestration in permanent grasslands on mineral soils
Revitalisation of Ash Forests	Restoration / revitalization of ash forests (essenbossen)
Recell	Extraction of cellulose from waste sludges
Hemp	Long-term C sequestration in hemp-based products
Blue carbon	Carbon sequestration in salt marshes
Recycling hard plastics	Recycling hard plastic above national baseline

Rewetting peatland

- Emissions from peatland in NL: 7 Mt CO₂
 - total emissions agriculture 27 Mt
- Methodology document:
 - Raising ditch water level
 - Water infiltration (pumps)
 - Embankment
- Baseline: business-as-usual groundwater levels (depends on region)
- Monitoring: digital wells
 - e.g. 6 wells for an area of 0-20 ha; 8 wells for 20-100 ha.)
- Certificates issued based on validated project plan and/or verification report

Jurasinski, G., Günther, A., Huth, V., & Couwenberg, J. (2016). Greenhouse gas emissions. In W. Wichtmann, C. Schröder, & H. Joosten, *Paludiculture – productive use of wet peatlands* (pp. 79-93, Chapter 5.1). Schweizerbart Science Publishers.

State of play

- 18 projects registered at SNK
 - 6 kt CO₂ issued (ex ante)
 - 39 kt emission reduction estimated.
- Price per certificate: €75 – 100/ton
- However, farmers find process complex -> beyond their core business
- Therefore, bundling of activities in larger programmes.

The screenshot displays the 'platform CO2 neutraal' website. The header is dark green with a 'menu' button and a search icon. A pink button in the top right corner says 'Koop CO2 certificaten'. Below the header, three project cards are shown, each with a category label, a status label, a photo, a title, a description, and a price.

Category	Status	Project Name	Description	Price
NATUUR	TE KOOP	Westzijderveld: primeur peilverhoging natuurgebied	Westzijderveld is de allereerste natuurlocatie in Nederland waaraan goedkeuring is verleend om met de Valuta voor Veen-methode te werken. Een primeur! Het is een prachtig gebied waar de schoonheid van de natuur tot zijn recht komt.	€ 100
AGRARISCH	UITVERKOCHT	Langweer: verborgen eilandpolder vol potentie voor klimaat en weidevogels	Verstopt in het veenweidegebied in de Friese gemeente De Fryske Marren ligt een pracht van een polder omzoomd met water. Een eilandpolder, ingeklemd tussen Aldhof, Geau en Hoaitesleat, bij Langweer. Dit 63 hectare grote gebied heeft de potentie om een aantrekkelijk agrarisch natuurgebied te worden.	€ 75
AGRARISCH	UITVERKOCHT	Lytse Deelen: een biodivers thuis voor weidevogels	Bevlogen, bewust, pragmatisch en enthousiast. De passie spat er van af bij Sjoerd en Douwe Miedema. Met elkaar werken zij dag in dag uit op biologische boerderij De Nije Mieden, hartje Friesland, vlakbij het natuurgebied De Alde Deelen. Voor zuivel en vlees op hoogwaardig niveau, maar óók voor een rijke biodiversiteit, kruidenrijk land, koeien die buiten lopen en een fijne plek voor weidevogels.	€ 75

Each card also includes a 'Meer informatie' link at the bottom.

From plan to certificate

1. Write a projectplan
2. Validation of the projectplan by external expert/reviewer
3. Implement project (incl. Monitoring)
4. Verification of reduction/removal by external expert
5. SNK issues certificate based on positive verification report ([in register](#))

SNK only issues certificates -> trading in certificates is done by parties themselves

Rulebook item: [Proces van projectplan tot uitgifte van certificaten](#)_(pdf).

Remote sensing for wetland habitats

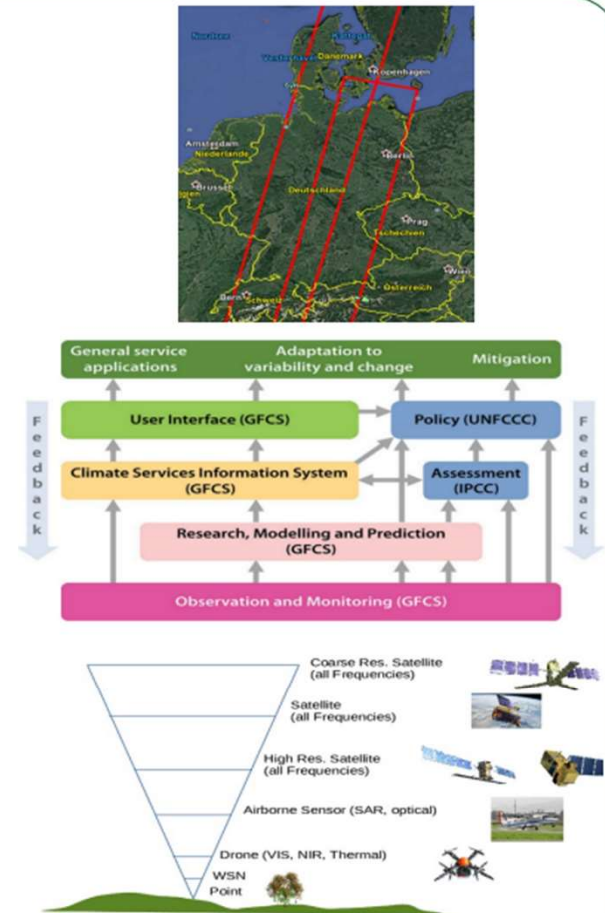

Prof. Dr. Philip Marzahn
Geodesy and Geoinformatics
University of Rostock

Why remote sensing?

- **Allows to perform measurements over large areas**
 - Direct:
 - Reflectance, emission, backscatter
 - Phase differences, range distances
 - Indirect:
 - “Plant as indicator”
- **Can provide input data to models at various scales**
- **Wide range of different sensors currently available**
 - Long time series
 - Multi-scale observation

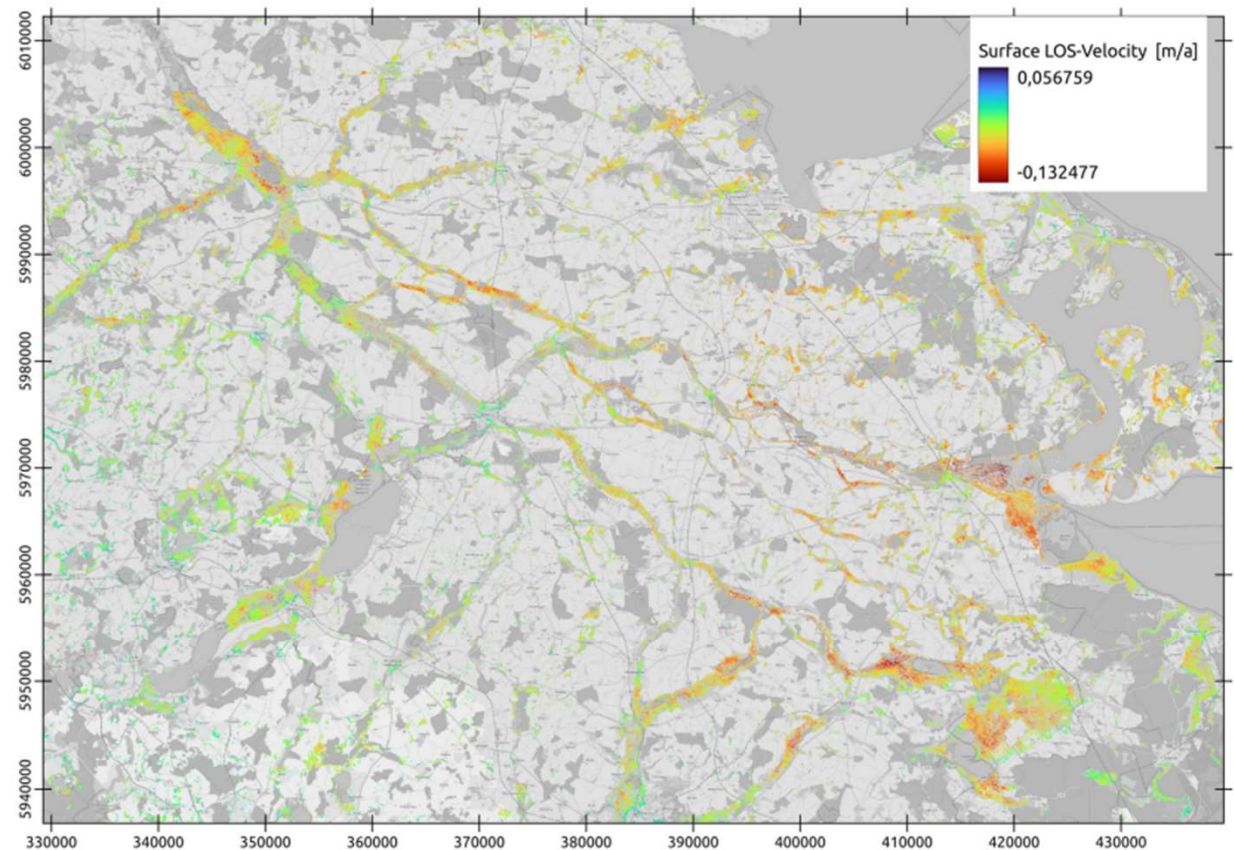

- **Subsidence monitoring**
 - Sentinel-1 SAR interferometry
 - Indicator of C mineralization
- **Monitoring of water levels and area**
 - Sentinel-1 based approach
 - Approach using machine learning
- **Additional surface parameters to support monitoring:**
 - Soil moisture
 - Vegetation parameters

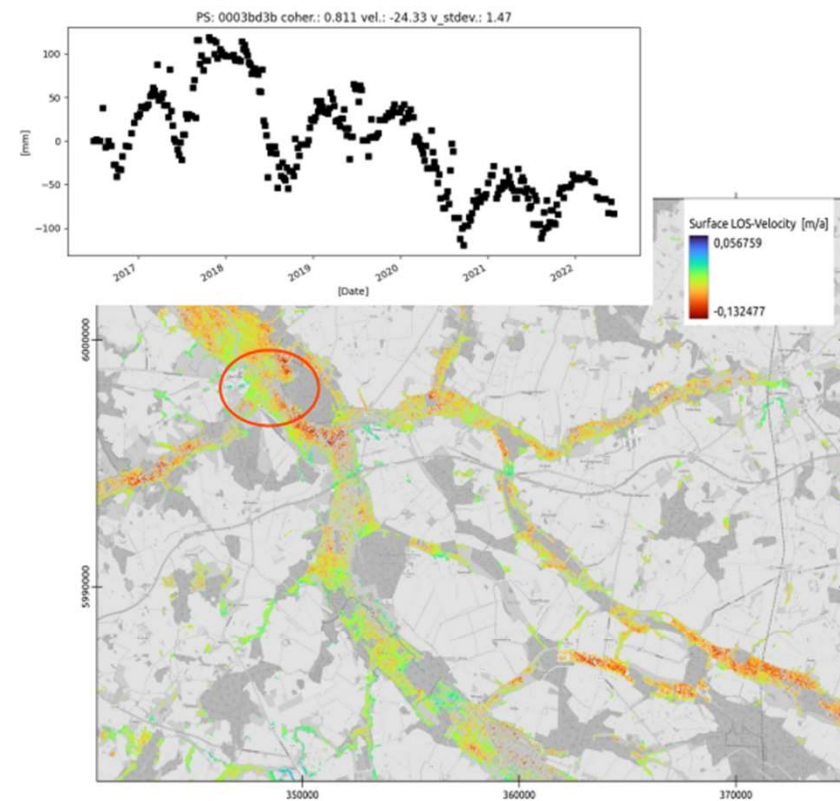

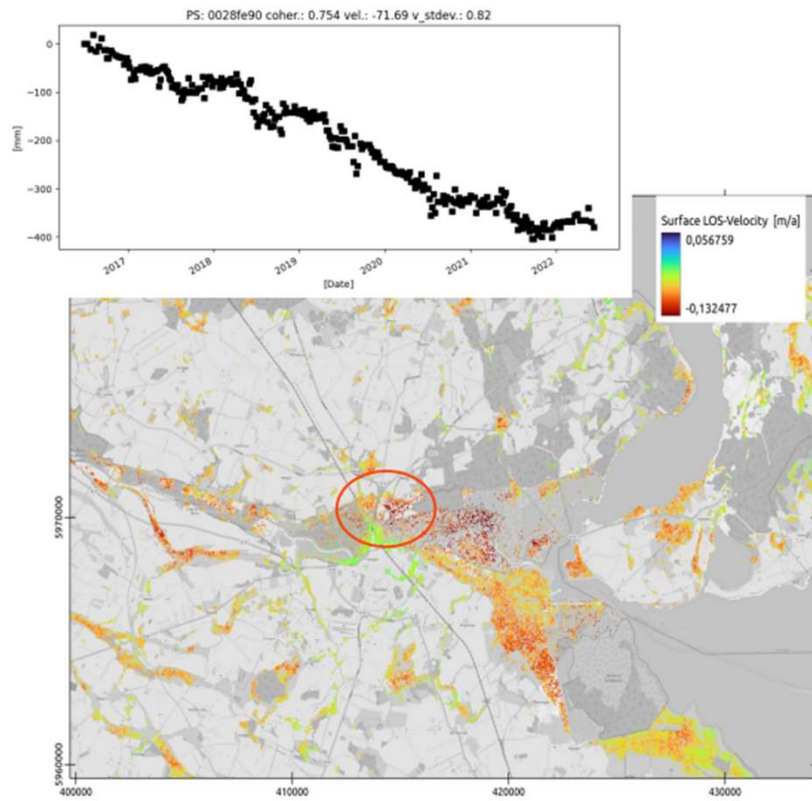

Subsidence monitoring of peatlands

- Remote sensing techniques allow for a spatio-temporal monitoring of wetlands
- Breathing (subsidence/heaving) of peatlands can be observed
- Subsidence of drained peatlands

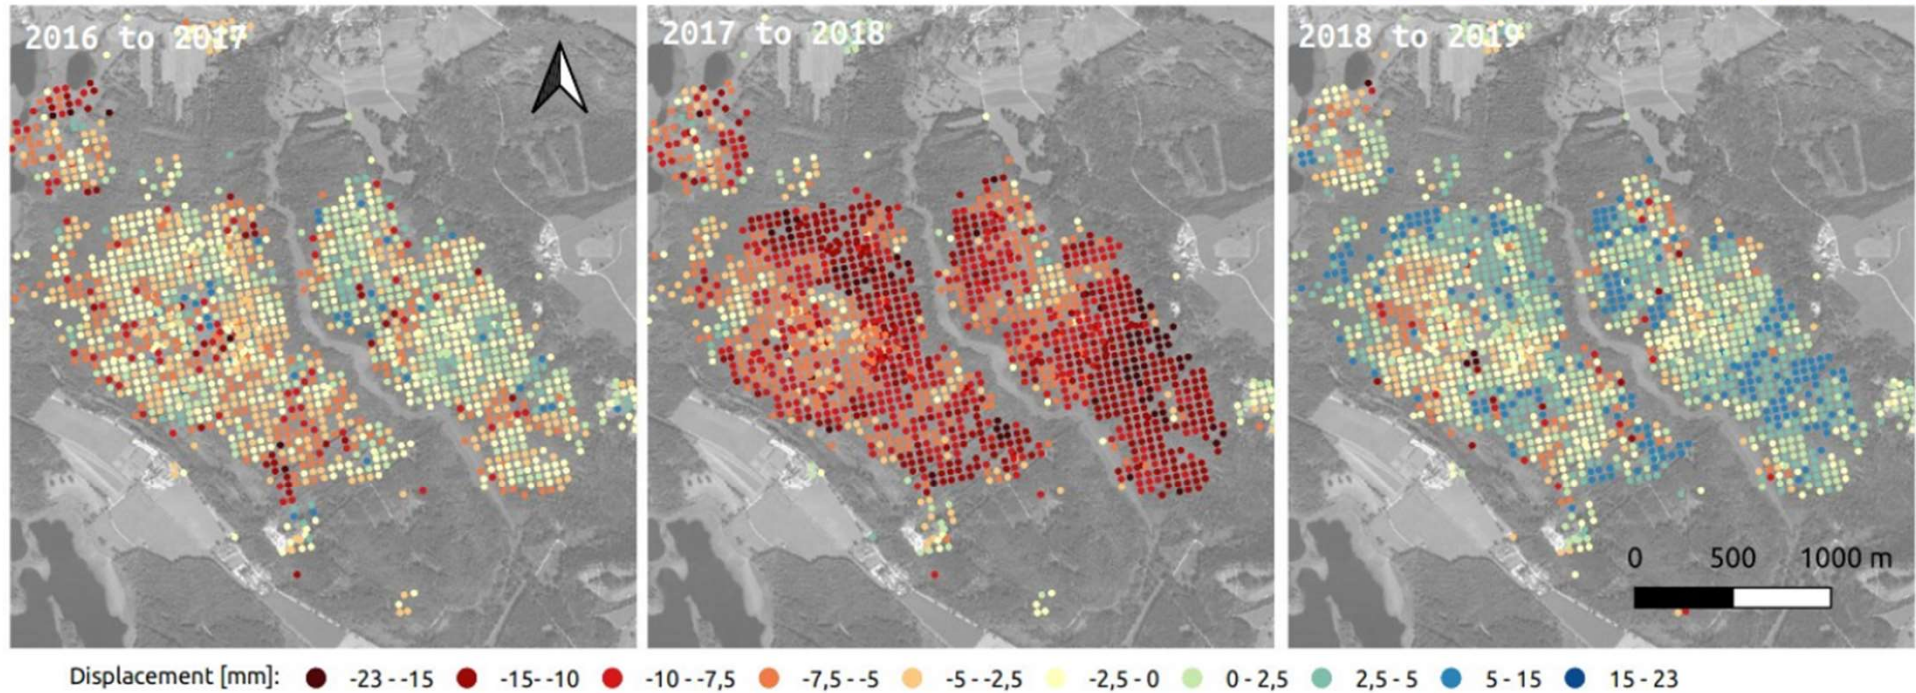

Subsidence monitoring of peatlands

- Seasonality and evaluation of re-wetting measures

Monitoring of wetlands

Real flood extent = temporary open water + temporary flooded vegetation

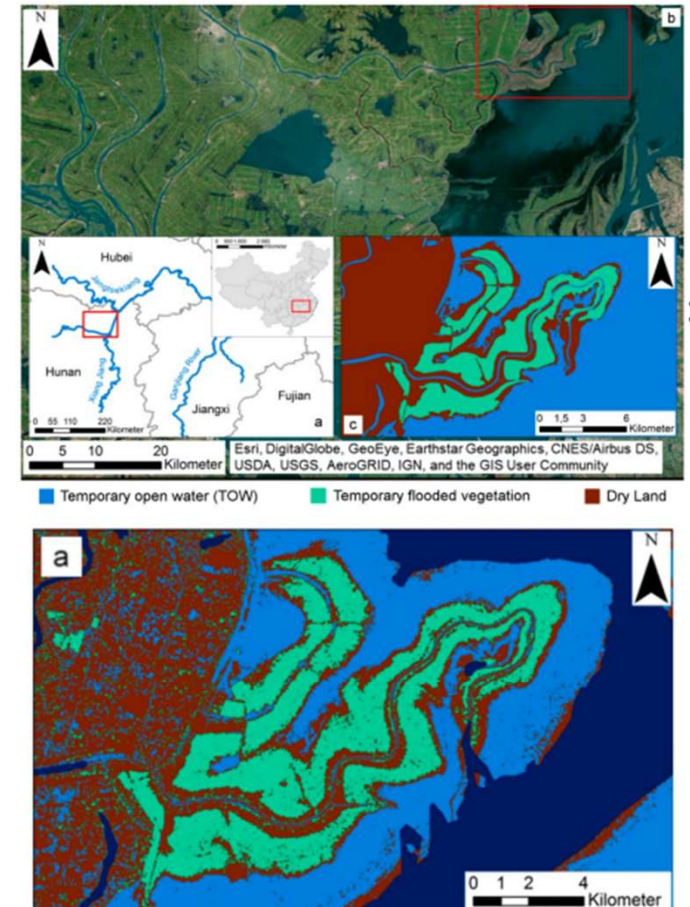

Monitoring of water levels and extend

Temporary open water

Temporary flooded vegetation

HPC and
machine learning
techniques
for real time
Monitoring

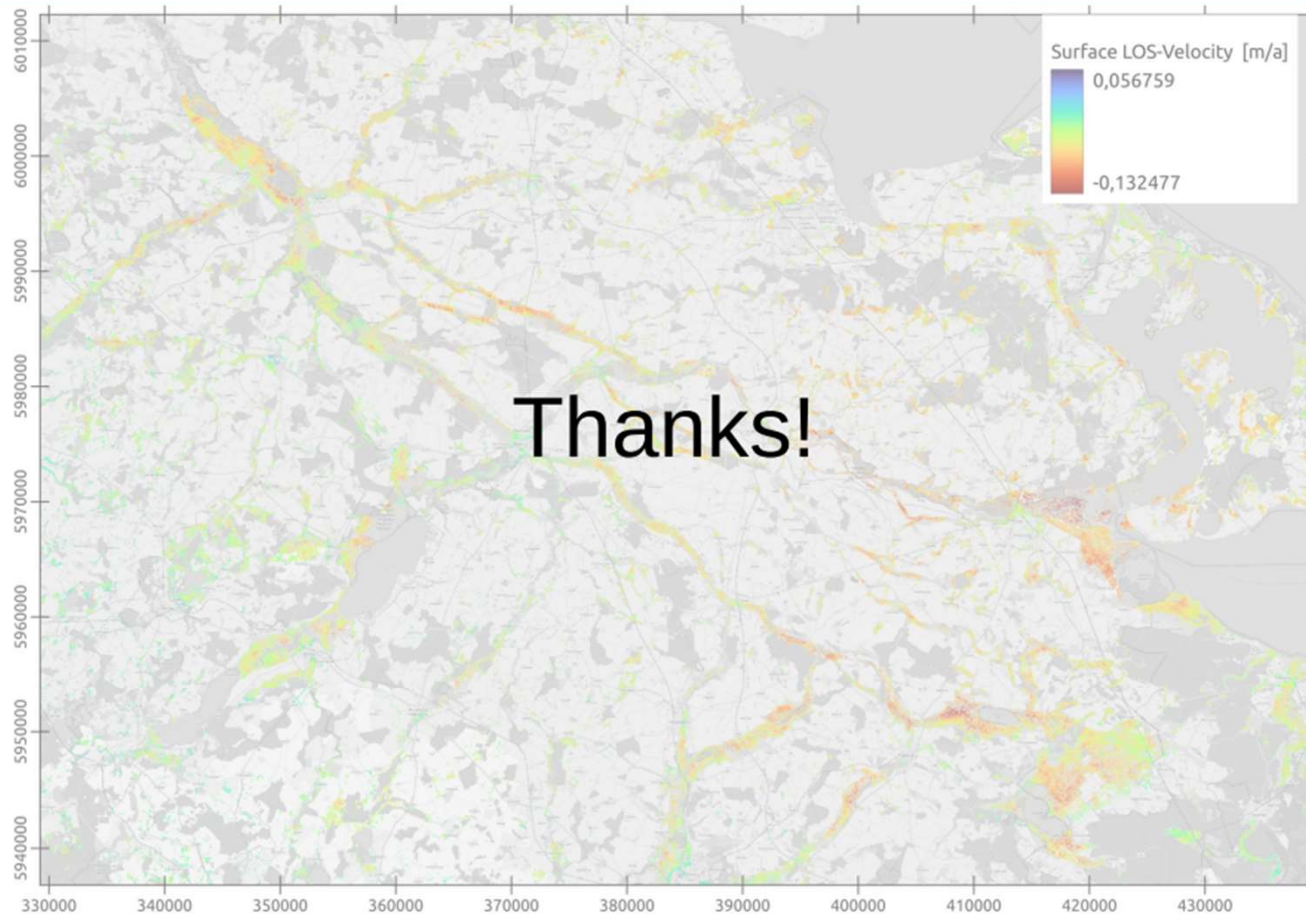

h

Conclusions

- **Remote sensing - especially microwave imagery - allow for a continuous monitoring of land surface processes**
 - Independent from illumination and weather conditions
 - Allow a penetration into a media
- **High potential for peatland monitoring with retrievals of:**
 - Subsidence of (peat-)surfaces
 - General subsidence patterns
 - Bog breathing
 - Water extend
 - Open water bodies
 - Submerged / flooded vegetation
 - Additional land surface parameters (not shown)
 - moisture contents (soil, vegetation)
 - Soil surface roughness
 - Land cover changes (mowing events, etc.)

Q&A on presentations

Discussion and conclusions by the rapporteur

Coffeebreak

Concluding session start at 15:45

Concluding session

- Takeaways from the rapporteurs
- Next steps by CRETA
- Concluding remarks by Christian Holzleitner (DG CLIMA)

CARBON FARMING - SUMMARY CONCLUSIONS

- Existing carbon farming certification methodologies show varying degrees of alignment to the Qu.A.L.I.T.Y criteria.
 - Additionality shows a high degree of alignment.
 - Methodologies vary for quantifying the carbon removed and stored in soils (calculated, modeled, measured, and hybrid approaches) as well as for setting baselines (project baselines).
 - Long-term storage varies to the length of the crediting and monitoring periods.
 - Liability pools vary in their scale and mechanisms proposed.
- Uncertainties around length of storage of carbon in soils and the end use of certificates were raised.

Next steps Carbon Farming

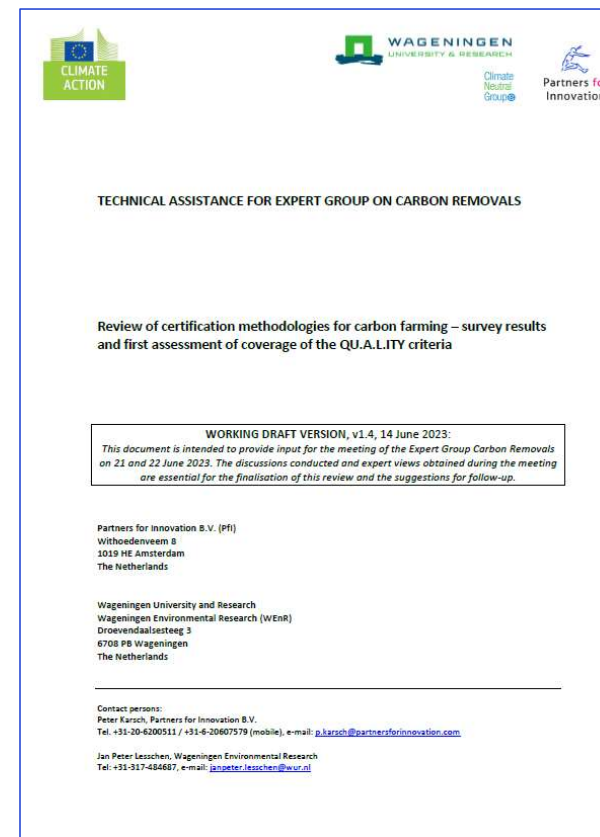

Carbon Farming meeting 22 June 2023

CRETA consortium

REVIEW OF EXISTING CERTIFICATION METHODOLOGIES

- Comments made during Expert Group meeting will be addressed
- Additional comments on Basecamp until 26 June
- Report will be finalised by half of July
- Will become publicly available

TECHNICAL SCOPING PAPERS

- Goal: how can the Q.U.A.L.I.T.Y criteria best be addressed in the development of certification methodologies in the context of the CFCR
- Build on results from review
- Include other studies that assessed methodologies, e.g. report of Ecologic
- Input from EG member: Provide comments, best practices, relevant reports, on basecamp, but make it specific
- Have discussions on specific topics with EG members, on basecamp, but maybe also online meetings
- Draft scoping papers by October/November for review
- Will be discussed during 5th EG meeting (Q1 2024)

Thank you

Contact:

janpeter.lesschen@wur.nl
