

COMMISSION OF THE EUROPEAN COMMUNITIES

Brussels, 29.11.2006

**COMMISSION DECISION**

**of 29 November 2006**

**concerning the national allocation plan for the allocation of greenhouse gas emission allowances notified by Lithuania in accordance with Directive 2003/87/EC of the European Parliament and of the Council**

## COMMISSION DECISION

of 29 November 2006

### concerning the national allocation plan for the allocation of greenhouse gas emission allowances notified by Lithuania in accordance with Directive 2003/87/EC of the European Parliament and of the Council

(Only the Lithuanian text is authentic)

THE COMMISSION OF THE EUROPEAN COMMUNITIES,

Having regard to the Treaty establishing the European Community,

Having regard to Directive 2003/87/EC of the European Parliament and of the Council of 13 October 2003 establishing a scheme for greenhouse gas emission allowance trading within the Community and amending Council Directive 96/61/EC<sup>1</sup>, and in particular Article 9(3) thereof,

Whereas:

- (1) The national allocation plan of Lithuania for the period 2008-2012, developed under Article 9(1) of Directive 2003/87/EC (hereinafter "the Directive"), was notified to the Commission by letter dated 7 July 2006 and registered by the Commission on 17 July 2006. Lithuania submitted additional information on the notified plan by letter dated 12 September 2006, registered on the same day, in reply to questions from the Commission. Lithuania notified a revised plan by letter dated 22 November 2006, registered on 23 November 2006.
- (2) The Climate Change Committee<sup>2</sup> considered the national allocation plan on 16 October 2006 and called on the Commission to assess all national allocation plans on a consistent, coherent and robust basis. In this context, the Climate Change Committee underlined the importance of using the 2005 verified emissions figures as a significant element for the assessment of second period national allocation plans. The Climate Change Committee also, *inter alia*, stressed the crucial importance of transparent and credible baseline data and projected emissions and urged the Commission to take into account the importance of preserving the integrity of the internal market and avoiding

---

<sup>1</sup> Directive 2003/87/EC of the European Parliament and of the Council of 13 October 2003 establishing a scheme for greenhouse gas emission allowance trading within the Community and amending Council Directive 96/61/EC, OJ L 275, 25.10.2003, p. 32, as amended by Directive 2004/101/EC of the European Parliament and of the Council of 27 October 2004, amending Directive 2003/87/EC establishing a scheme for greenhouse gas emission allowance trading within the Community, in respect of the Kyoto Protocol's project mechanisms, OJ L 338, 13.11.2004, p. 18.

<sup>2</sup> Decision 280/2004/EC of the European Parliament and of the Council of 11 February 2004 concerning a mechanism for monitoring Community greenhouse gas emissions and for implementing the Kyoto Protocol, OJ L 49, 19.02.2004, p. 1, established under Article 9 thereof.

undue distortions of competition. The Committee expressed concern that the proposed cap amounts to about twice as much as 2005 verified emissions and urged the Commission to scrutinise that installations are not allocated more allowances than needed. It expressed concern about the growth rates assumed for incumbents in different sectors and called on the Commission to closely scrutinise whether they are realistic and robust and that sufficient substantiation will be provided. Furthermore, the Committee called on the Commission to scrutinise the plan with a view to avoiding the double counting of growth in output and emissions by means of both allocating on the basis of expected growth to installations listed in the plan (including on the basis of paragraph 54 of the Commission's allocation guidance) and building a new entrants' reserve and to examine benchmarks used for new entrants. Moreover, the Committee urged the Commission to closely scrutinise the assumptions underlying and implications of the replacement of the nuclear power plant Ignalina, including the allocation methodologies for replacement capacities and consequences for export/import of electricity. The Committee urged the Commission to ensure in its assessment of the plan that the scope with respect to combustion installations, as outlined in the Commission's 2005 guidance and as co-ordinated in the Committee meeting of 31 May 2006, is followed by Lithuania. The views of the Climate Change Committee have been taken into account.

- (3) The national allocation plan, including the total quantity of allowances of annually 16.686 million tonnes CO<sub>2</sub> equivalent (hereinafter "million tonnes") stated therein, has been evaluated against the criteria contained in Annex III to and Article 10 of the Directive, taking into account the Commission's guidance to Member States on the implementation of these criteria<sup>3</sup>. Certain aspects of the national allocation plan have been found incompatible with those criteria, and in particular with criteria 1, 2, 3, 6 and 10 in Annex III to the Directive.
- (4) The national allocation plan contravenes criteria 1, 2 and 3 of Annex III to the Directive because the total quantity of allowances intended to be allocated is more than would be consistent with assessments of actual and projected progress made pursuant to Decision 280/2004/EC and more than would be consistent with the potential, including the technological potential, of activities covered by the Community scheme to reduce emissions. Criteria 2 and 3 provide for a methodology using the most representative emissions figures, taking into account economic growth and carbon intensity improvements. Pursuant to criterion 1, the total quantity of allowances to be allocated shall not be more than is likely to be needed for the strict application of the criteria of Annex III.
- (5) With respect to criterion 2, in the Commission's most recent assessment<sup>4</sup> made pursuant to Decision 280/2004/EC, the actual greenhouse gas emissions of the sectors covered by the Community Scheme in Lithuania in 2005 are reported as being 6.6 million tonnes<sup>5</sup>. These emission figures are the most reliable and accurate emissions

---

<sup>3</sup> Commission Communication on guidance to assist Member States in the implementation of the criteria listed in Annex III to Directive 2003/87/EC (COM(2003)830 final) and Commission Communication on further guidance on allocation plans for the 2008 to 2012 trading period of the EU Emission Trading Scheme (COM(2005)703 final).

<sup>4</sup> COM(2006)658 final of 27 October 2006 and Annex SEC(2006)1412 of 27 October 2006.

<sup>5</sup> Chapter 3.3. of COM(2006)658 final of 27 October 2006 and Table 5 in the Annex SEC(2006)1412 of 27 October 2006. The exact figure is 6.603869 million tonnes as indicated in the Community Independent Transaction Log on 31 October 2006.

figures for the Commission to use as a starting point for the assessment under criteria 2 and 3 because they have been reported by individual installations in Lithuania falling under the Community scheme and have been independently verified pursuant to Article 15 of the Directive. In addition, the figures correspond precisely to the scope of installations included by Lithuania in the Community scheme in the phase 2005 to 2007. Emissions figures given by Lithuania in respect of earlier years have not been independently and consistently verified with a comparably high degree of accuracy and it is not clear that they correspond precisely to the scope of installations included by Lithuania in the Community scheme, and thus they are less reliable. Therefore, it cannot be excluded that emissions figures reported by Lithuania in respect of earlier years overstate actual emissions. A starting point, which would be calculated as the average of independently verified emissions figures from 2005 and other figures proposed by Lithuania, would be likely not to truly represent actual emissions and would not ensure overall allocation not to be more than is needed. The Commission notes that due to insufficient substantiation by Lithuania no expansion in the scope of activities covered by the Directive from the first to the second phase in line with the Commission's guidance<sup>6</sup> can be accounted for. While the Commission has requested further information on this figure Lithuania has failed to provide substantive information quantifying this expansion in terms of allowances. The Commission underlines that Lithuania remains obliged to include all additional combustion installations concerned in line with the Commission's guidance during the period from 2008 to 2012.

- (6) The Commission is aware of the opinion brought forward by some Member States, but not endorsed by the Climate Change Committee, in favour of averaging independently verified emissions figures with Member States' estimates of emissions over other years in order to smooth out singular events in one particular year. However, in each year there are several factors, including weather patterns, influencing aggregate emissions that generally balance each other out over one year in their effects on total annual emissions. The Commission has examined the availability and quality of other data concerning emissions and energy use prior to 2005. The Commission does not have sufficient indications that a clear majority of exceptional circumstances manifestly pointed in one direction in 2005 and that therefore 2005 verified emissions figures cannot be regarded as representative. Consequently, the Commission considers that there are no sufficient reasons with respect to Lithuania to adjust independently verified emissions figures for 2005, taking into account, amongst others, that the Lithuanian electricity generating sector relies only in a negligible manner on hydro-electric power, which is dependent on precipitation.
- (7) The Commission underlines that this approach is also compatible with the Commission's guidance that allocations to individual installations should not be based on changes in the emissions of those installations within the first phase<sup>7</sup>. The determination of the total quantity of allowances, on the one hand, and the distribution of the total quantity to individual installations, on the other hand, are separate issues and subject to different considerations. Similarly, the Commission's guidance concerning the reward for early action relates to sector and installation level

---

<sup>6</sup> Point 36 of COM(2005)703 final, as clarified by the "co-ordinated definitions" of additional combustion installations contained in the minutes of the Climate Change Committee of 31 May 2006.

<sup>7</sup> Chapter 3.7, point 27 of COM(2005)703 final.

allocations, but not the total quantity of allowances, as is clear from the heading of the relevant chapter<sup>8</sup>.

- (8) With respect to criterion 3, the Commission notes that for a national allocation plan to be consistent with the potential, including the technological potential, of activities covered by the scheme to reduce emissions requires a rigorous assessment of total allocations in accordance in particular with projections of economic growth and improvements in carbon intensity<sup>9</sup>. The Commission has assessed the figures at its disposal, including those in the public domain, with a view to calculating Lithuania's projected emissions. In order to derive the total quantity of allowances that is consistent with the potential, including the technological potential, of activities covered by the Community scheme to reduce emissions, the 2005 aggregate independently verified emission figures of installations in the Community scheme have been multiplied with two factors: firstly, the projected gross domestic product (thereafter "GDP") growth rate and, secondly, the rate for carbon intensity improvement, each in the period from those independently 2005 verified figures to 2010. The Commission considers 2010 to constitute a representative average of the relevant five-year period from 2008 to 2012 because 2010 is the year in the middle of this period and, in the Commission's view, it is appropriate from an *ex-ante*-perspective to assume a linear trend over this five-year period. The resulting figures are compared with Lithuania's proposed allocation so as to determine to what extent it is in line with criterion 3, taking into account that Lithuania has not sufficiently quantified the effects from the expansion in the scope of activities covered by the Directive from the first to the second phase to be applied by Lithuania in line with the Commission's guidance<sup>10</sup>. Of all data at its disposal, including those in the public domain, the Commission considers the data indicated in the PRIMES model<sup>11</sup> as the most accurate and reliable estimations of both GDP growth<sup>12</sup> and carbon intensity

---

<sup>8</sup> Chapter 3.7, point 28 of COM(2005)703 final.

<sup>9</sup> See in particular point 11 of COM(2005)703 final.

<sup>10</sup> Point 36 of COM(2005) 703 final, as clarified by the "co-ordinated definitions" of additional combustion installations contained in the minutes of the Climate Change Committee of 31 May 2006.

<sup>11</sup> PRIMES is a modelling system that simulates a market equilibrium solution for energy supply and demand in the EU Member States. The model determines the equilibrium by finding the prices of each energy form such that the quantity producers find best to supply match the quantity consumers wish to use. The equilibrium is static (within each time period) but repeated in a time-forward path, under dynamic relationships. The model is behavioural but also represents in an explicit and detailed way the available energy demand and supply technologies and pollution abatement technologies. The system reflects considerations about market economics, industry structure, energy/environmental policies and regulation. These are conceived so as to influence market behaviour of energy system agents. The modular structure of PRIMES reflects a distribution of decision making among agents that decide individually about their supply, demand, combined supply and demand, and prices. Then the market integrating part of PRIMES simulates market clearing. PRIMES is a general purpose model. It is conceived for forecasting, scenario construction and policy impact analysis. It covers a medium to long-term horizon. It is modular and allows either for a unified model use or for partial use of modules to support specific energy studies. More information can be found on the following website: <http://www.e3mlab.ntua.gr/>.

<sup>12</sup> The GDP growth assumptions are based on the Commission's Economic and Financial Affairs Directorate-General's forecasts of April 2005 for the short term (2004-2006) as well as the long term (2005-2030). More specifically, short terms fore-casts are taken from European Commission Economic Forecasts, Spring 2005 (EUROPEAN ECONOMY. No. 2/ 2005. Office for Official Publications of the EC.ISBN92-894-8881-6), also published on the website: [http://europa.eu.int/comm/economy\\_finance/publications/european\\_economy/2005/ee205en.pdf](http://europa.eu.int/comm/economy_finance/publications/european_economy/2005/ee205en.pdf). Long-term forecasts are taken from European Commission, DG ECFIN "Long Run Labour Productivity and

improvement rates. The PRIMES model has been used for analysis of energy and climate policy for a long time and the baseline assumptions<sup>13</sup> are updated on a regular basis to reflect the most likely future trend. Furthermore, baseline assumptions are validated with the involvement of experts from Member States. The most recently updated baseline was published in 2006. There is no other data source at the disposal of the Commission, which offers a comparable degree of consistency and uniform accuracy across all Member States, thus ensuring equal treatment of Member States.

- (9) The PRIMES model has been concretely applied on the basis of a coherent set of assumptions and methodologies for the publication "*European Energy and Transport Trends*" of the Commission's Directorate-General for Transport and Energy<sup>14</sup> and for the publication of its Environment Directorate-General containing the calculation of baseline scenarios for the revision of the National Emission Ceilings Directive<sup>15</sup>. The figures for GDP and 2005 carbon intensity are identical in both publications, while for 2010 the figure for carbon intensity<sup>16</sup> differs<sup>17</sup>. Where there is a low carbon constraint instead of an even less stringent one, carbon intensity will improve more over time due to the stronger incentive for operators to reduce emissions.
- (10) The introduction of the Community scheme in 2005 and the strong commitments by the EU and Member States to combat climate change provide a clear and sustained signal to installations covered by the Community scheme that there is an economic cost to emitting greenhouse gases, which will become even more important in the future. This reinforces long-term economic incentives to reduce emissions. As a consequence, carbon intensity will improve over time at least at a rate as indicated in the "low carbon constraint / no CCS"-case<sup>18</sup>.

---

Potential Growth Rate Projections For the EU25 countries up to 2050 (information note for Members of the EPC's working group on ageing populations)", ECFIN/50485/04-EN.

<sup>13</sup> Examples for baseline assumptions are future developments in population, fuel prices, etc.

<sup>14</sup> European Energy and Transport, Trends to 2030 – update 2005, European Commission, Directorate-General for Energy and Transport, 2006, prepared by the Institute of Communication and Computer Systems of National Technical University of Athens (ICCS-NTUA), E3M-Lab, Greece, Authors: Dr. L. Mantzos and Prof. P. Capros, published on the Commission's website under the following hyperlink: [http://ec.europa.eu/dgs/energy\\_transport/figures/trends\\_2030\\_update\\_2005/energy\\_transport\\_trends\\_2030\\_update\\_2005\\_en.pdf](http://ec.europa.eu/dgs/energy_transport/figures/trends_2030_update_2005/energy_transport_trends_2030_update_2005_en.pdf)

<sup>15</sup> Directive 2001/81/EC of the European Parliament and of the Council of 23 October 2001 on national emission ceilings for certain atmospheric pollutants. The baseline scenarios are published on the Commission's website under the following hyperlink: <http://ec.europa.eu/environment/air/baseline.htm>

<sup>16</sup> "Carbon intensity" can be defined in various ways and is for the purpose of this Decision understood as the relationship between CO<sub>2</sub> emissions and a unit of GDP (see below for precise definition).

<sup>17</sup> Due to the effect of the introduction of a low carbon constraint, the carbon intensity in 2010 is improved in the "low carbon constraint"-scenario in the publication containing the calculation of baseline scenarios for the revision of the National Emission Ceilings Directive, whereas the scenario established in the publication "*European Energy and Transport Trends*" is based on an even less stringent carbon constraint.

<sup>18</sup> Taking into account that carbon capture and sequestration ("CCS") is highly unlikely to already be available to a significant extent during the period 2008-12. The "low carbon constraint / no CCS"-scenario for the respective Member State is published on the Commission's website under the following hyperlink: <http://ec.europa.eu/environment/air/baseline.htm>. Both relevant figures are indicated for the respective Member State on the sheet "Summary Energy Balance and Indicators (B)" under "Main Energy System Indicators". Under this heading, the figures for "GDP (in 000 MEUR'00)" are indicated in the second row, and the figures for "CO<sub>2</sub> emissions to GDP (t of CO<sub>2</sub>/MEUR'00)", which the Commission considers the adequate expression of carbon intensity for its assessment, are indicated in the second last row.

- (11) The Commission considers that this level of carbon intensity improvement does not appropriately reflect most likely future trends because it does not take account of all relevant factors, including recent developments. In addition to the economic incentives created by the Community scheme, operators will be likely to increasingly invest in energy efficient technologies in order to lower their fuel and electricity costs. Moreover, they will increasingly be encouraged by policies and measures of the EU and Member States as well as public opinion to accelerate efforts with regard to innovation in energy saving production methods and thus take effective action against climate change. At EU level, collective efforts to reduce dependency of energy imports as well as measures identified in the new Energy Efficiency Action Plan<sup>19</sup> with a view to realising the EU's energy saving potential, will further spur efforts to achieve better energy efficiencies, reducing in general also carbon intensity.
- (12) The Commission considers that the combined effect of reinforced energy efficiency measures identified in the Energy Efficiency Action Plan and the existence of a carbon constraint due to the Community scheme will lead to an annual improvement rate in carbon intensity for each Member State in excess of the rate reflected in the "low carbon constraint"-case. Consequently, the Commission considers it necessary to further improve the absolute value of carbon intensity arising from the "low carbon constraint"-case. While the "low carbon constraint" under the Community scheme leads at EU level to an average annual improvement rate in carbon intensity of 2.37%<sup>20</sup>, the Commission considers that the magnitude and importance of additional measures identified in the new Energy Efficiency Action Plan justifies in principle assuming a similar quantitative effect for the latter. Recognising however the potential partial overlaps between both policy instruments and also that not all the measures identified in the Energy Efficiency Action Plan may be fully implemented by 2010, the Commission considers that the corresponding additional average annual rate for carbon intensity improvements should be adjusted downwards. More specifically, in order to exclude any potential overestimation of the total effects, the Commission takes a conservative estimate of an additional average annual rate of 0.5% for carbon intensity to improve further, which corresponds to a total additional carbon intensity improvement of 2.5%<sup>21</sup> over the entire period from 2005 to 2010 compared to the "low carbon constraint"-case. Therefore, in order to appropriately reflect reality, the Commission considers it necessary to base the assessment under criterion 3 in Annex III to the Directive on a rate of carbon intensity improvement exceeding the "low carbon constraint"-case by 2.5% during the five-year period from 2005 to 2010.
- (13) In the light of the above, the following table indicates the data for the developments from 2005 to 2010 of both GDP and carbon intensity in Lithuania in absolute terms. The corresponding relative development factors and growth rates from 2005 to 2010 are also indicated:

---

<sup>19</sup> Action Plan for Energy Efficiency: Realising the Potential, Communication from the Commission, COM(2006)545 final

<sup>20</sup> As indicated in the "low carbon constraint"-case for "EU25" in the baseline scenarios for the revision of the National Emission Ceilings Directive under <http://ec.europa.eu/environment/air/baseline.htm>, the absolute figure for the EU's absolute carbon intensity in 2005 is 391.0 tonnes per million Euro GDP (in year 2000 value). For 2010, the corresponding figure is 346.8 tonnes per million Euro GDP. Therefore, the total improvement in the period from 2005 to 2010 can be calculated as 346.8/391, which gives 0.887 or 11.3%. The EU's annual average carbon intensity improvement rate is calculated as (346.8/391)<sup>1/5</sup>, which gives 0.9763 or 2.37%.

<sup>21</sup>  $1.005^{1/5} = 1.02525$ , which corresponds to 2.5% (after rounding).

Calculation element	2005	2010	Relative development factor 2005-2010	Growth 2005-2010
GDP <sup>22</sup>	17.4	23.9 <sup>23</sup>	1.373563 <sup>24</sup>	37.3563% <sup>25</sup>
Carbon intensity <sup>26</sup>	620.1	616.6		
Carbon intensity with additional improvement of 2.5%		601.185 <sup>27</sup>	0.969497 <sup>28</sup>	-3.05031% <sup>29</sup>

On the basis of this, the following table shows the calculation of the annual excess allocation for the period from 2008 to 2012, i.e. the difference between the annual average allocation proposed by Lithuania and the allocation resulting from the strict application of criteria 2 and 3. Concretely, the latter is calculated as the product of the total 2005 verified emissions figure<sup>30</sup> and the relative development factors of GDP and carbon intensity from 2005 to 2010, as indicated in the above table. In addition, the resulting amount is increased to take into account the effect from the increase in scope from the first to the second trading phase in line with the Commission's guidance, while using the overall figure envisaged by Lithuania to be allocated to these additional installations concerned:

Calculation of the annual excess allocation for the period from 2008 to 2012 (all figures in million tonnes CO2 eq.)						
2005 verified	2005 verified emissions multiplied by	verified relative	effect from increase in scope from	Resulting allowed annual	Annual average allocation on	Annual average excess

<sup>22</sup> This figure is expressed in thousand million Euro value year 2000.

<sup>23</sup> The Commission's Economic and Financial Affairs Directorate-General released in November 2006 its "Economic Forecasts Autumn 2006", published in EUROPEAN ECONOMY. No. 5/2006, Office for Official Publications of the EC, ISSN 0379-0991, and on the Commission's website under the following hyperlink: [http://ec.europa.eu/economy\\_finance/publications/european\\_economy/2006/ee506en.pdf](http://ec.europa.eu/economy_finance/publications/european_economy/2006/ee506en.pdf). In order to take into account these most recent figures available to the Commission, the GDP figure for 2010 indicated in the above-mentioned publications "European Energy and Transport Trends" and the one for the calculation of baseline scenarios for the revision of the National Emission Ceilings Directive has been adapted as follows: In a first step, the average annual GDP development factor from 2005 to 2010 is calculated on the basis of the figures contained in the publication "European Energy and Transport Trends", i.e.  $(23.1/17.4)^{1/5}$ , which gives 1.058309. In a second step, this annual average development factor is replaced by the more recent development factors from the "Economic Forecasts Autumn 2006" for those years, for which they are available (see p. 79 therein), i.e. the years 2006 (factor of 1.078), 2007 (factor of 1.07) and 2008 (1.065). For the years 2009 and 2010, the average annual development factor as calculated in the first step is taken. In a third step, the overall development factor from 2005 to 2010 is calculated by multiplying the indicated annual development factors, i.e.  $1.078 * 1.07 * 1.065 * 1.058309 * 1.058309$ .

<sup>24</sup>  $23.9/17.4$

<sup>25</sup>  $((23.9/17.4)-1)\%$

<sup>26</sup> This figure is expressed in terms of CO2 Emissions to GDP (tonne of CO2/million Euro value year 2000).

<sup>27</sup>  $616.6 * (1-0.025)$ . The additional improvement of 2.5% is mathematically expressed with the factor of (1-0.025).

<sup>28</sup>  $616.6 * (1-0.025)/620.1$

<sup>29</sup>  $((616.6 * (1-0.025)/620.1)-1)\%$ . The negative figure indicates an improvement in carbon intensity, meaning that the amount of CO2 emitted to produce one unit of GDP decreases over time.

<sup>30</sup> As all installations in Lithuania have been verified in 2005, there is no need for a correction factor.

emissions	development factors 2005-2010 for GDP and carbon intensity	1 <sup>st</sup> to 2 <sup>nd</sup> phase	average total quantity from 2008-2012	basis of proposed national allocation plan	allocation
6.603869	8.794143 <sup>31</sup>	0.057161	8.851304	16.59	7.738696 <sup>32</sup>

Accordingly, given that in the years 2008 to 2012 proposed allocations exceed emissions taking into account GDP growth, carbon-intensity improvements, the Commission finds that the annual average excess allocation by Lithuania in the period 2008 to 2012 amounts to 7.738696million tonnes, which contravenes criteria 1, 2 and 3.

- (14) Lithuania has proposed to include 0.057161 million tonnes of allowances in the total quantity in respect of emissions of these additional combustion installations annually, which have not been included in the first period plan. Allocations to these installations need to take place in accordance with the general methodologies stated in the national allocation plan, and only take place to the extent that the emissions of these installations have been substantiated and verified.
- (15) The Commission takes note of the provisions in the Lithuanian National Allocation Plan relating to the closure of the nuclear power plant "Ignalina" by the end of 2009. The Commission notes that according to the Lithuanian government this would have the consequence that the forecasted electricity production of "Ignalina" as of the end of 2009 would need to be replaced with existing capacities of carbon-intensive electricity generating installations. The Commission also notes that the Lithuanian government provides for an overall amount of allowances to compensate for an increase in emissions in the electricity sector due to this closure. According to Lithuania's National Allocation Plan, these allowances are intended to be allocated after the decision pursuant to Article 11(2) of the Directive 2003/87/EC has been taken.<sup>33</sup>
- (16) The Commission considers that the provisions in Lithuania's NAP relating to the quantity of allowances to compensate for an increase in emissions in the electricity sector due to the closure of the "Ignalina" nuclear power plant as well as its allocation methodology are in contravention of criteria 3 and 10 of the Annex III to the Directive. Criterion 3 requires that a national allocation plan shall be consistent with the potential, including the technological potential, of activities covered by the scheme to reduce emissions. The Commission has assessed the figures at its disposal, including those in the public domain, with a view to calculating Lithuania's projected emissions, including an increase of its emissions due to the closure of the "Ignalina" nuclear power plant. Such an increase in emissions is, however, already adequately reflected in the "low carbon constraint"-case for Lithuania in the publication containing the calculation of baseline scenarios for the revision of the National Emission Ceilings Directive<sup>34</sup> which the Commission has used to determine the overall quantity of allowances in line with criteria 2 and 3. It therefore finds that the proposed special reserve for the closure of the "Ignalina" nuclear power plant contravenes criterion 3 of Annex III to the Directive.

<sup>31</sup> 6.603869 \*1.373563\*0.969497

<sup>32</sup> (16.59 – 8.851304= 7.738696)

<sup>33</sup> Sections 1, 2 and 4 of the national allocation plan.

<sup>34</sup> As indicated above, see the Summary Energy Balance and Indicators (A) and (B) for Lithuania as published under: <http://ec.europa.eu/environment/air/baseline.htm>.

- (17) In addition, the Commission finds that the provisions in the proposed plan relating to the procedure of allocating allowances to compensate for an increase in emissions due to the closure of the "Ignalina" nuclear power plant contravene criterion 10 in Annex III to the Directive. Criterion 10 in Annex III requires the quantity of allowances to be allocated to each installation to be stated *ex-ante* in the national allocation plan covering the period referred to in Article 11(2) of the Directive and not to adjust the allocation of allowances set out in the national allocation plan after the adoption of the decision referred to in Article 11(2) of the Directive. However, the procedure in the plan provides that the allowances are intended to be allocated after the decision pursuant to Article 11(2) of the Directive has been taken<sup>35</sup>.
- (18) Such so-called ex-post adjustments contradict the essential concept of a "cap-and-trade" system as conceived by the Directive. Under the Community scheme, each installation is allocated a certain amount of allowances in the decision referred to in Article 11(2) of the Directive, whose value it can freely dispose of with a view to taking optimal economic decisions. Three major alternatives exist, which are equally legitimate: investing in emissions reductions and selling freed allowances, reducing production volume and selling freed allowances, or maintaining/expanding production volume while buying additional allowances needed.
- (19) The Commission considers that there is no administrative need or any other justification for ex-post adjustments. Member States are required to use the best data available when deciding on allocations up-front. As a matter of fact, the use of prognoses always requires to a certain degree an ex-ante estimation of emissions the actual volume thereof may eventually deviate in reality. This is an inherent feature of any "cap-and-trade" scheme and can thus certainly not justify a retroactive change to the allocation already decided upon up-front. Moreover, the reasons for such a deviation cannot be reliably identified and may well be the result of emissions reductions due to real investments having been carried out by operators in line with the economic incentives created by the scheme.
- (20) The Directive allows only for two adjustments following the decision referred to in its Article 11(2) where such retroactive change does not occur or does not have a detrimental impact on the functioning of the Community scheme: firstly, where an installation is closed during the trading period, that Member States determine that there is no longer an operator to whom allowances will be issued; and, secondly, where allocation takes place to new entrants from the reserve, that Member States determine the exact allocation to each new entrant.
- (21) Pursuant to criterion 5 of Annex III to the Directive, the Commission has also examined compliance of the national allocation plan of Lithuania with the provisions of the Treaty, and in particular Articles 87 and 88 thereof. The Commission considers that the allocation of allowances free of charge to certain activities confers a selective economic advantage to undertakings which has the potential to distort competition and affect intra Community trade. The allocation of allowances for free appears to be imputable to the Member State and to entail the use of State resources to the extent that more than 90% of allowances are given for free. The aspects of imputability and State resources are further strengthened in the second trading period as the participation as of 2008 in international emissions trading and in the other flexible

<sup>35</sup> Section 4 of the revised national allocation plan of 15 November 2006 .

mechanisms, the Joint Implementation and the Clean Development Mechanism, enables the Member States to take further discretionary decisions influencing their budgets and the number of EU allowances granted to industry. In particular, as all allocations must as from the start of the second trading period be covered by Assigned Amount Units<sup>36</sup>, which are tradable between contracting parties, any allocation directly reduces the quantity of Assigned Amount Units that the Member State can sell to other contracting parties or increases the need to buy such Assigned Amount Units. The Commission therefore at this stage considers that the plan could potentially imply State aid pursuant to Article 87(1) of the Treaty. On the basis of information provided by Lithuania, the Commission at this stage cannot consider with certainty that any potential aid granted under the national allocation plan is consistent with and is necessary to achieve the overall environmental objective of the Directive. Non-compliance with criteria 1, 2 and 3 fundamentally jeopardises the overall environmental objective of the emission trading scheme. The Commission considers that in such a case the environmental benefit of any aid included in the allowances may not be sufficient to outweigh the distortion of competition referred to above. The Commission notes in particular that an allocation exceeding projected emissions will not require beneficiaries to deliver an environmental counterpart for the benefit they receive. The Commission at this stage therefore cannot exclude that any aid involved would be found incompatible with the common market should it be assessed in accordance with Articles 87 and 88 of the Treaty.

- (22) Pursuant to criterion 5 of Annex III to the Directive, the Commission has examined the methodology by which Lithuania intends to allocate allowances at sector and installation level. Unduly high allocations may arise in particular in the glass, brick, ceramic and rock wool production sectors, of which the growth figures remain insufficiently substantiated in their relation to the expected growth of the overall economy. Moreover, Lithuania does not demonstrate that information provided by associations or companies has been verified by independent experts. In addition, the ex ante allocation to installations in the electricity sector relating to the closure of the Ignalina nuclear power plant is unclear and intransparent and does not seem to reflect likely production levels under normal market conditions. Therefore, due to the lack of sufficient safeguards the proposed allocation methodology may lead to unduly discriminatory advantages to certain sectors or installations.. For these reasons, the Commission at this stage and on the basis of the currently available information cannot exclude that any State aid involved in the allocations may partially be found incompatible with the common market should it be assessed in accordance with Articles 87 and 88 of the Treaty.
- (23) Pursuant to criterion 6 of Annex III to the Directive, the plan shall contain information on the manner in which new entrants will be able to begin participating in the Community scheme. The Commission notes that the plan contravenes criterion 6 because the information contained therein, in particular the proposed methods of allocation to new entrants, is insufficient for the Commission to ensure that the other criteria of Annex III to and Article 10 of the Directive, in particular its criterion 3, are respected.

<sup>36</sup> Article 45 of the Commission Regulation (EC) No 2216/2004 of 21 December 2004 for a standardised and secured system of registries pursuant to Directive 2003/87/EC of the European Parliament and of the Council and Decision No 280/2004/EC of the European Parliament and of the Council, OJ L 386, 29.12.2004, p. 1.

- (24) In order to bring the national allocation plan in conformity with the criteria listed in Annex III to the Directive, the plan should be amended. The Commission should be notified of the amendments made to the plan in accordance with this Decision by Lithuania as soon as possible, taking into account the time-scale necessary to carry out the national procedures without undue delay. Were Lithuania to amend its national allocation plan in a non-discriminatory manner in accordance with Article 2 of this Decision and duly taking into account the Commission's observations in recital 22, the Commission considers that any potential aid, is likely to be compatible with the common market should it be assessed in accordance with Articles 87 and 88 of the Treaty.
- (25) Information in the national allocation plan not relevant for the allocation of allowances for the period referred to in Article 11(2) of the Directive has not been taken into account for the purposes of this Decision. In addition, Information in the national allocation plan relating to Lithuania's intended unilateral inclusion of additional activities pursuant to Article 24 of the Directive has not been taken into account for the purposes of this Decision but will be subject to a separate application by Lithuania and decision by the Commission as provided for in Article 24 of the Directive.
- (26) The reports on the implementation of policies and measures and the use of the Kyoto Protocol's mechanisms submitted by Member States pursuant to Decision 280/2004/EC are important sources of information for the evaluation of the national allocation plans pursuant to criterion 2 of Annex III to the Directive.
- (27) Pursuant to Article 9(3), second sentence, of the Directive, the Member State shall only take a decision under Article 11(2) of the Directive if proposed amendments are accepted by the Commission. The Commission accepts all modifications of the allocation of allowances to individual installations within the total quantity to be allocated to installations listed therein resulting from technical improvements to data quality. No further prior assessment and acceptance by the Commission is necessary because the allocation methodology and the total quantity of allowances remain unchanged. As the modification is limited to mechanically adjusting the result from the use of data of higher quality having become available more recently to the intended allocation, any such modification cannot be conceived to be incompatible with the criteria of Annex III to or Article 10 of the Directive. Similarly, decreasing the share of allocation of allowances free of charge within the limits set in Article 10 of the Directive is accepted, since it requires no prior assessment by the Commission. The Commission considers that such a decrease cannot *per se* be conceived to discriminate between companies or sectors in such a way as to unduly favour certain undertakings or activities in the light of criterion 5 or contravene any other criteria of Annex III to the Directive.
- (28) The whole procedure comprising the notification to, assessment and possible rejection by the Commission of the national allocation plans and the final allocation decisions to be taken by Member States is foreseen by the Directive in a short schedule and implemented by the decisions taken pursuant to its Article 9(3) so as to ensure that the system operates effectively with a minimum of uncertainty for market participants.
- (29) Accordingly, Member States are not entitled to propose any amendments to national allocation plans, including to the total quantity of allowances stated therein, after the

deadline of 31 December 2006 specified in Article 11(2) of the Directive, other than those foreseen in the respective Commission decision on a national allocation plan<sup>37</sup>. The interpretation of the deadline of 31 December 2006 specified in Article 11(2) as a "cut-off deadline" is proportionate in balancing the interest of a Member State to exert its discretion on substantive issues and the interest of the Community to ensure the functioning of the emissions trading scheme,

HAS ADOPTED THIS DECISION:

#### *Article 1*

The following aspects of the national allocation plan for the first five-year period mentioned in Article 11(2) of the Directive of Lithuania are incompatible respectively with:

1. criteria 1, 2 and 3 of Annex III to the Directive: the part of the intended total quantity of allowances, amounting to 7.738696 million tonnes CO<sub>2</sub>eq per year, that is not consistent with assessments made pursuant to Decision 280/2004/EC and not consistent with the potential, including the technological potential, of activities to reduce emissions; in addition, the part of the total quantity potentially amounting to 0.057161 million tonnes of allowances in respect of additional emissions of combustion installations annually to the extent that this is not justified in accordance with the general methodologies stated in the national allocation plan and on the basis of substantiated and verified emission figures;
2. criterion 6 of Annex III to the Directive: the information on the manner in which new entrants will be able to begin participating in the Community scheme;
3. criterion 10 of Annex III to the Directive: the provision of the Lithuanian national allocation plan to adjust the allocation of allowances to an installation listed in the national allocation plan and operating in its territory after the decision pursuant to Article 11(2) of the Directive has been taken.

#### *Article 2*

No objections shall be raised to the national allocation plan, provided that the following amendments to the national allocation plan are made in a non-discriminatory manner and notified to the Commission as soon as possible taking into account the time-scale necessary to carry out the national procedures without undue delay:

1. the total quantity to be allocated for the Community scheme is reduced by 7.738696 million tonnes CO<sub>2</sub>eq of allowances per year; and the quantities allocated to

additional combustion installations are determined in accordance with the general methodologies stated in the national allocation plan and on the basis of substantiated and verified emission figures, with the total quantity being further reduced by any difference between the allocations to these installations and the 0.0571616 million tonnes set aside annually for these installations;

2. information is provided on the manner in which new entrants will be able to begin participating in the Community scheme, in a way that complies with the criteria of Annex III to and Article 10 of the Directive;
3. the allocation of allowances to an installation listed in the national allocation plan and operating in its territory is not adjusted after the decision pursuant to Article 11(2) of the Directive has been taken.

#### *Article 3*

1. The average annual total quantity of allowances of 8.851304 million tonnes, reduced by any difference between the allocations to additional combustion installations and the 0.057161 million tonnes set aside annually for these installations, to be allocated by Lithuania according to its national allocation plan to installations listed therein and to new entrants shall not be exceeded.
2. The national allocation plan may be amended without prior acceptance by the Commission if the amendment consists in modifications of the allocation of allowances to individual installations within the total quantity to be allocated to installations listed therein resulting from improvements to data quality or to reduce the share of the allocation of allowances free of charge within the limits set in Article 10 of the Directive.
3. Any other amendments of the national allocation plan, apart from those made to comply with Article 2 of this Decision, must be notified by the deadline of 31 December 2006 referred to in Article 11(2) of the Directive and require prior acceptance by the Commission pursuant to Article 9(3) of the Directive.

#### *Article 4*

This Decision is addressed to Lithuania.
