

# Reducing HDV CO<sub>2</sub> emissions

Stakeholder meeting 3/7/2012

# Reducing HDV CO<sub>2</sub> emissions

Afternoon session

*Policy options  
to reduce HDV fuel consumption and  
CO<sub>2</sub> emissions*

# Reducing HDV CO<sub>2</sub> emissions

*Options:*

- 1, "Status quo", baseline scenario including already approved / proposed policies*
- 2, Implement Transport White Paper actions*
- 3, Improve knowledge and transparency on HDV CO<sub>2</sub> emissions*
- 4, Include HDV emissions in EU ETS*
- 5, Set mandatory emission limits*

# Reducing HDV CO<sub>2</sub> emissions

## *Option 1: Baseline scenario*

- *decoupling with GDP*
- *improved fuel efficiency of vehicles : + 1% annually*
- *implementation of existing or proposed directives. e.g. implementation of Directives 2009/28/EC and 2009/30/EC on bio-fuels*

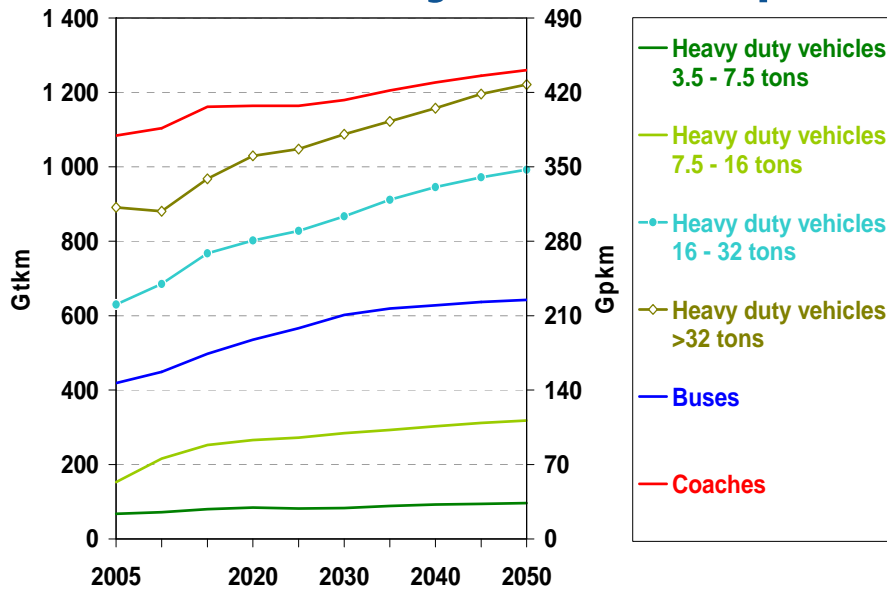

## Option 1 - Baseline scenario : A number of existing & proposed EU legislation and programmes already expected to contribute lowering HDV CO<sub>2</sub> emissions, e.g.:

- *"Clean vehicles" Directive 2009/33 on procurement of public authorities' HDVs*
- *EU funded R&D programme « Green car initiative » covering HDVs*
- *Low Carbon Fuel Standard – Directive 2009/30 (setting 6% life cycle GHG reduction requirement by 2020).*
- *Improved logistics and fleet management: ITS directive (2010/40/EU)*
- *Proposed Revised Energy Taxation Directive COM(2011)168/3 with new minimum tax rates.*
- *Road user charging: recent Eurovignette Directive revision*
- *Tyre labelling and rolling resistance legislation*

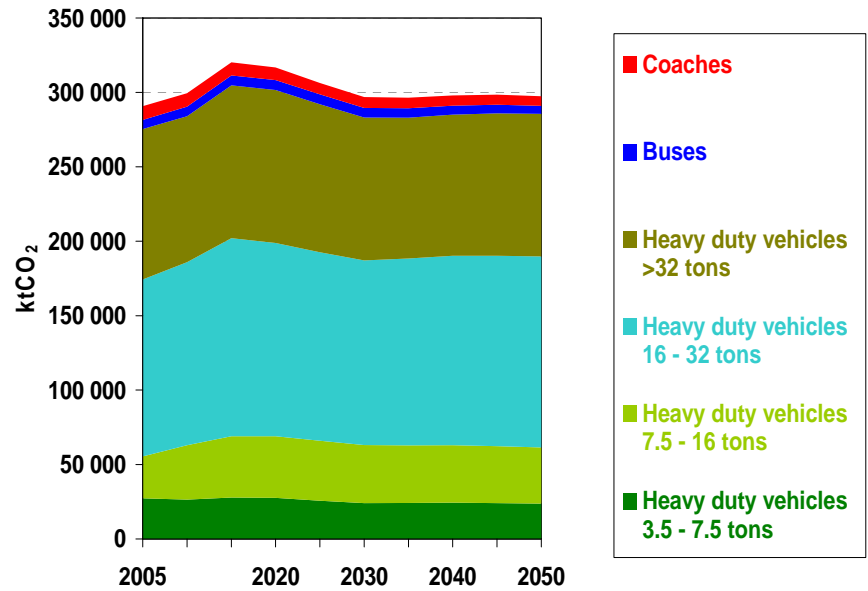

# Reducing HDV CO<sub>2</sub> emissions

Latest PRIMES-TREMOVE modelling, baseline scenario

## HDV Activity Gtkm / Gpkm

## TTW emissions HDVs ktCO<sub>2</sub>

# Reducing HDV CO<sub>2</sub> emissions

## *Baseline scenario (option 1) assessment*

*HDV transport would not significantly contribute to meeting EU GHG objectives and Transport White Paper specific objectives for transport (-60% by 2050 vs 1990)*

*Conclusion → Baseline "no policy change" scenario not sustainable*

# Reducing HDV CO<sub>2</sub> emissions

## *Option 2: Implement Transport White Paper announced actions*

- *Review cabotage legislation (Regulation 1072/2009/EC)*
- *Review road user charging (Directive 2011/76/EU)*
- *Review weights and dimensions legislation (Directive 96/53/EC, Regulation EC/661/2009 and Directive 2007/46/EC)*
- *e-freight initiative*
- *Transport carbon footprint : encourage certification, develop common standards*
- *Zero emission urban logistics initiative*
- *Clean power for transport initiative*

# Reducing HDV CO<sub>2</sub> emissions

***Option 3:** improve knowledge & transparency of HDV CO<sub>2</sub> emission*

- step one: finalise development of simulation tool 2014/2015*
- step two: introduce a registration / reporting regulation*
- possible step three: certification/labelling tool*

# Reducing HDV CO<sub>2</sub> emissions

## *Option 3 Assessment*

'Pros': *- a necessary step for other measures such as setting limits or ETS inclusion*  
*- costs limited to measurement & recording of emissions*

Limitations: *will not as such be sufficient for materially lowering emissions. An action to implement in tandem with others.*

# Reducing HDV CO<sub>2</sub> emissions

***Option 4: include HDVs in EU Emissions Trading Scheme (ETS = carbon market)***

*Preliminary step: recording emissions*

# Reducing HDV CO<sub>2</sub> emissions

## ***Option 4, including HDV transport in EU ETS***

*Assessment:*

*In view of marginal costs of lowering CO<sub>2</sub> emissions (CE Delft curves), HDV Operators would most likely prefer trading ETS allowances rather than investing in upgrades (carbon price only marginally influencing fuel price effect in cost curves)*

*(see attached cost curve)*

*→ limited effectiveness in curbing transport emissions, emission cuts would take place in other sectors*

# Reducing HDV CO<sub>2</sub> emissions

## Example: Regional delivery truck cost curve

| Project name                     | Capital cost (€) | Additional fuel saving percentage (%) | NPV (€) | Marginal abatement cost (€/tCO <sub>2</sub> ) | Cumulative carbon savings (%) |
|----------------------------------|------------------|---------------------------------------|---------|---|-------------------------------|
| Fuel efficiency improvements     | -                | 6,9%                                  | 11.338  | -343,41                                       | 6,9%                          |
| Predictive cruise control        | 81               | 1,4%                                  | 2.214   | -331,29                                       | 8,3%                          |
| Low resistance tires             | 873              | 9,6%                                  | 14.949  | -324,46                                       | 17,9%                         |
| Transmission friction red.       | 202              | 1,0%                                  | 1.484   | -302,28                                       | 19,0%                         |
| Advanced engine                  | 3.920            | 8,7%                                  | 10.329  | -248,93                                       | 27,6%                         |
| Automatic tire inflation trailer | 283              | 0,4%                                  | 431     | -207,27                                       | 28,1%                         |
| Boat tail                        | 1.414            | 2,2%                                  | 2.132   | -206,45                                       | 30,2%                         |
| Full gap fairing                 | 1.011            | 1,0%                                  | 709     | -141,64                                       | 31,3%                         |
| Full skirts                      | 2.425            | 1,7%                                  | 399     | -48,48  | 33,0%                         |
| Material substitution            | 2.401            | 1,5%                                  | 22      | -3,10   | 34,5%                         |
| Gen II dual hybrid               | 18.794           | 6,6%                                  | -8.024  | 255,84  | 41,0%                         |
| Automatic tire inflation tractor | 3.638            | 0,4%                                  | -3.056  | 1.804,50                                      | 41,4%                         |

# Reducing HDV CO<sub>2</sub> emissions

## *Option 4, including HDV transport in EU ETS*

- limited effectiveness in curbing transport emissions*
- efficiency conundrum*
- predictability : high as regards emission amount, but low as regard cost (tCO<sub>2</sub> price fluctuation)*

# Reducing HDV CO<sub>2</sub> emissions

## *Option 5: set limits*

- 5,i      *either CO<sub>2</sub> engine-only limits*
- 5,ii     *whole vehicle emissions limits*

# Reducing HDV CO<sub>2</sub> emissions

## *Option 5,i*

*Setting engine-only limits*

*Measurement foreseen under EuroVI regulation*

*Requirements:*

*step 1 reporting +*

*step 2 ad hoc legislation setting limits*

# Reducing HDV CO<sub>2</sub> emissions

## *Option 5,i Assessment*

### *Setting engine-only limits*

Pros: "light" in terms of regulation and limited costs

Limitation: not comprehensive, will only contribute addressing part of the problem. Will not seize the full potential for HDV CO<sub>2</sub> emission abatement. Untapped potential reductions.

# Reducing HDV CO<sub>2</sub> emissions

***Option 5,ii***      *Setting CO<sub>2</sub> emission limits on whole vehicle emissions*

*Preliminary requirements:*

- a./ completion of simulation tool development*
  - b./ registration/reporting regulation needs to be adopted beforehand*
  - c./ precise reporting baseline required*
- a rather long-term option*

# Reducing HDV CO<sub>2</sub> emissions

## *Option 5,ii Effectiveness : high potential*

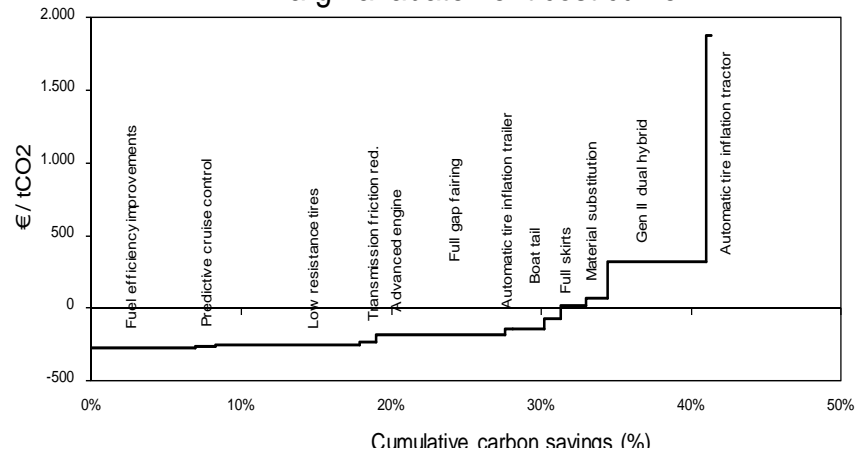

### Urban delivery

Marginal abatement cost curve

### Regional delivery

Marginal abatement cost curve

# Reducing HDV CO<sub>2</sub> emissions

Assessment summary, **option 5,ii** whole registered vehicle emission mandatory limits:

- *Effectiveness : potentially high - In view of rather long-term feature CO<sub>2</sub> abatement potential and costs would have to be fully re-assessed in due course.*
- *Important economic & employment benefits*
  - a./ *transfer of value from oil industry to HDV manufacturing*
  - b./ *reduced operating cost of transport*
- *Efficiency: limited costs vs high benefits*

# Reducing HDV CO<sub>2</sub> emissions

## *Timing considerations*

| Option                                | Short-term | Medium- term | Long-term |
|---------------------------------------|------------|--------------|-----------|
| 2, Improve knowledge and transparency | <b>X</b>   | <b>X</b>     |           |
| 3, White Paper Transport actions      | <b>X</b>   | <b>X</b>     | <b>X</b>  |
| 4, Include HDV transport in EU ETS    |            | <b>X</b>     | <b>X</b>  |
| 5, Mandatory emission limits          |            | <b>X</b>     | <b>X</b>  |

*Thank you for your attention*
