

# New concepts for fiber based packaging and energy efficiency

Jyrki Huovila  
Valmet Paper Business Line  
June 17<sup>th</sup> 2019

## Lower CO<sub>2</sub> emissions

- Low Energy & No Effluent Mill concept
- New technology PM unit processes
- Digitalization and Industrial Internet services for continuous optimized production

# Increased need of packaging demands sustainable processes

## Need for sustainable packaging

2017 - Total size of packaging business **€600 billion/a**  
- Fiber based 36%  
- Plastic 40%  
Fiber based growing 3-6%/a

## Increasing eCommerce

2017 - Global sales reached **US\$ 2.3tn**  
forecasted to grow **141%**  
between 2016 to 2021

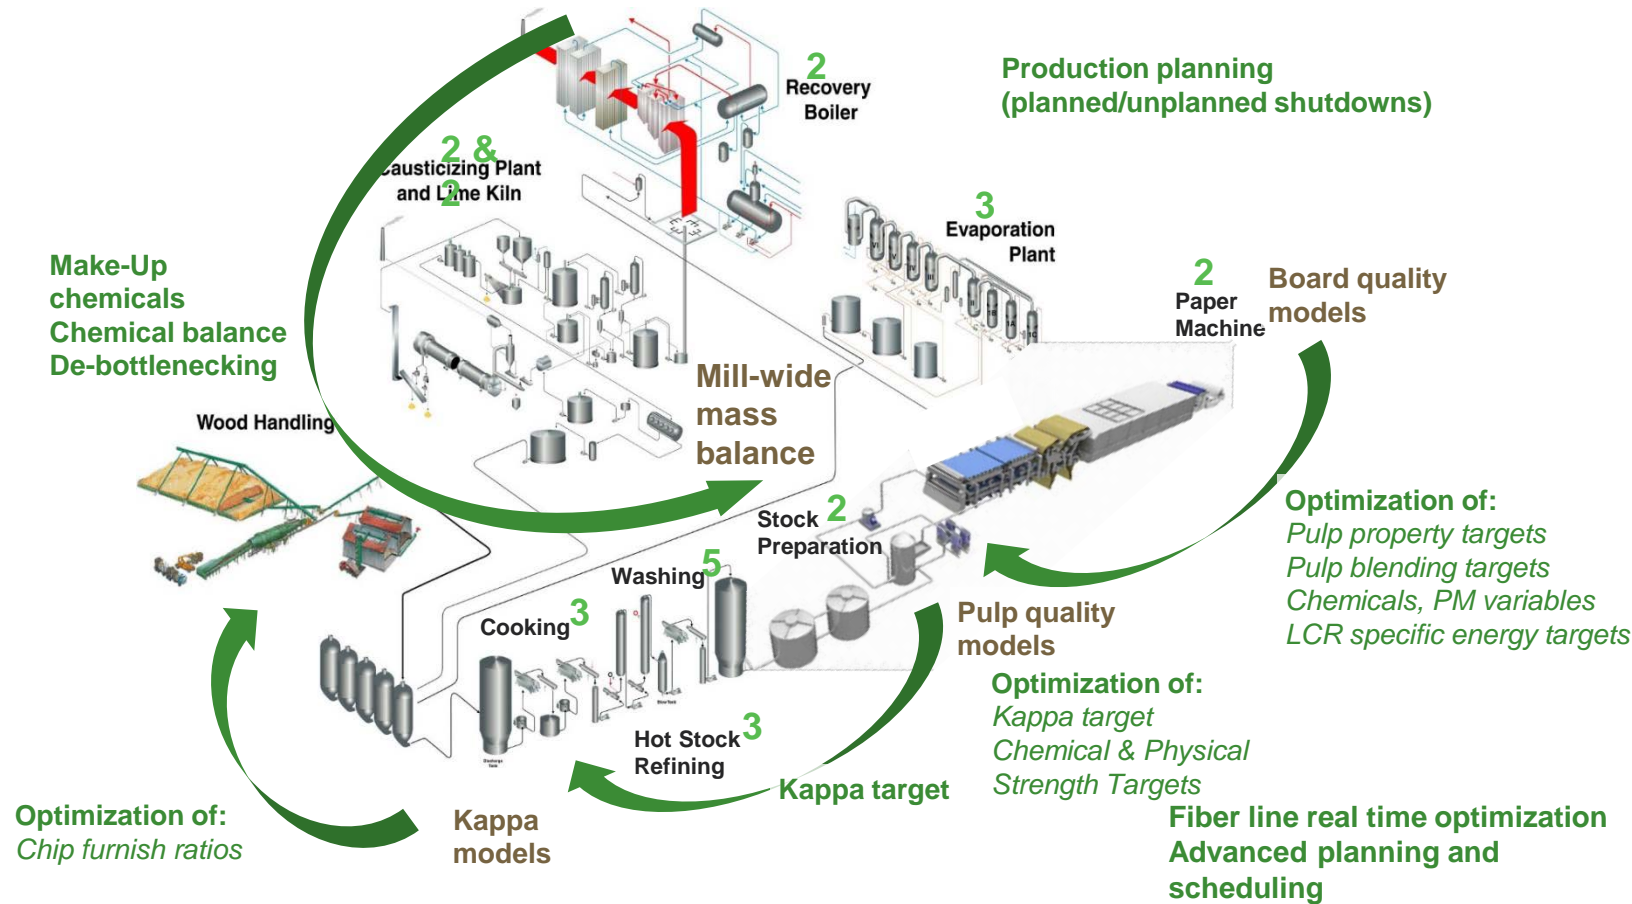

## Demonstration needs

- Light weight packaging materials (MFC, special natural fibers, new production processes)
- Energy efficient processes
- End products with better recyclability
- CO<sub>2</sub> free PM processes

**Possibility to 10-20% saving in specific energy consumption**

# Industrial Internet – mill-wide optimization through high level coordination

Automated decision making from chips to final product

## Solution

- Mill Wide Optimization by Digitalization and Industrial Internet services enable keeping production continually at optimum energy- and raw material consumptions and optimum product quality

## Energy saving potential

- Operating at optimum production continually has an annual saving potential of 20 Million MWh globally (saving 50 kWh/ton x 400 Mton/a)

## Challenges

- Basic technologies exist
- System and sub-system maturity needs to be developed and demonstrated
- Mill Wide Digital Twin is a considerable up-front investment
