

# Mobile 2020: Utility cycling in small towns in Eastern Europe

Greg Spencer, project manager

REGIONAL ENVIRONMENTAL CENTER

# In this presentation

- Description of the Mobile 2020 project
- Main results
- Challenges regarding GHG-reduction component of project evaluation

# Mobile 2020 project

- Promoting cycling as transport in smaller communities (<350,000) in Central and Eastern Europe
- 2011-2014
- Intelligent Energy Europe Programme

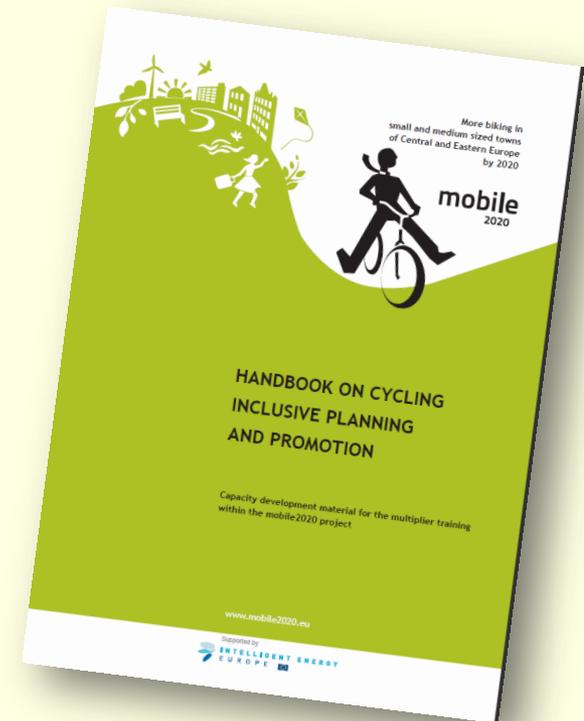

# Partners and roles

<b>Partner</b>	<b>Role</b>
<b>Baltic Environmental Forum</b>	<b>Coordination, implementation in Estonia and Latvia</b>
<b>Regional Environmental Center of Central and Eastern Europe</b>	<b>Results evaluation; implementation in Czech Rep., Slovakia, Croatia, Hungary, Poland, Bulgaria, Slovenia, and Romania</b>
<b>Atgaja Community</b>	<b>Implementation in Lithuania</b>
<b>Technical University Hamburg-Harburg</b>	<b>Climate change mitigation evaluation</b>
<b>Institute for Social-Ecological Research (DE)</b>	<b>Curriculum development</b>
<b>International Bicycle Consultancy</b>	<b>Utility cycling advice</b>

# Approach

- Developed curriculum, trained trainers
- Held seminars for municipal transport staff on:
  - Infrastructure design
  - Integrated transport planning
  - Communications/promotions
  - Cycling services (e.g. bike share systems, route finders)

# Approach (continued)

- Held promotional events (e.g. bike-friendly city awards, cycling video contest)

# Approach (continued)

- Developed national networks devoted to cycling promotion. Members represented:
  - national transport ministries,
  - municipalities,
  - city associations,
  - cycling advocates,
  - experts

# Main results

- 63 cycling development seminars delivered in 11 countries (5 to 11 per country)
- Staff from 375 municipalities were trained
- Cycling development handbook adapted and translated for all 11 countries
  - In Bulgaria, adopted into curriculum of the University of Architecture, Civil Engineering and Geodesy, Sofia.

# Main results (cont'd)

- 78 cities reported project impacts
  - Bike-friendly traffic management
  - New cycling strategies, work plans
  - Infrastructure investments started

# Main results (cont'd)

- Some nationwide impacts
  - Slovakian government began work on national utility cycling strategy
  - In Czech Republic, 33 cities formed Association of Bike-Friendly Cities
  - In Hungary, cycling strategic document identified funding priorities for 2014-2020 EU funding cycle

# GHG evaluation -- aims

- To find a correlation between different cycling development measures (similar to ones in Mobile 2020) and their impacts on GHG emissions
- To do a “profound analysis” of potential GHG emissions in a Mobile 2020 project city
- To create a toolkit for evaluation of cycling development strategies and their GHG-reduction potential

# GHG evaluation -- results

Unfortunately ...

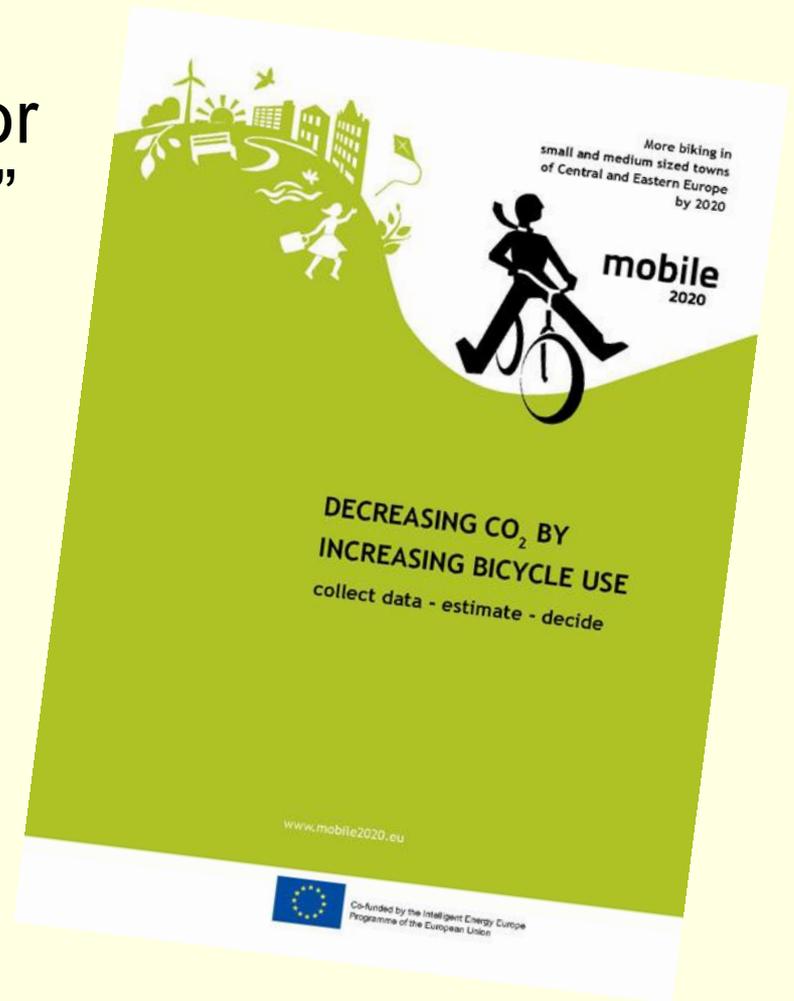

- Desk research turned up zero studies evaluating GHG impacts of cycling measures
- Transport data for smaller cities barely exists (e.g. modal split data existed for just 12 of 375 project cities)
- Toolkit for GHG evaluation of cycling strategies was not possible

# GHG evaluation -- results

However ...

- Made carbon calculator to “give an impression” of GHG savings given *modal shift target*

# GHG calculator

- Assumes increase in cycling leads to decrease in driving and public transport use
- Based on data from German transport surveys
- Data needed: city population, baseline modal split, target share increase for cycling
- Accuracy improves by using local rather than default data (GHG performance of local public transport and car fleet, average daily trips/inhabitant, etc.)

# Hypothetical example: Tartu, Estonia

- Used modal split data from EPOMM and population from Wikipedia
- Then forecast GHG reductions for three scenarios

	<b>1. Business as usual</b>	<b>2. Moderate cycling promotion</b>	<b>3. Aggressive cycling promotion</b>
<b>Modal shift</b>	1 percent	5 percent	10 percent
<b>Increase in cycling trip lengths</b>	20 percent	25 percent	30 percent

# Example: Tartu, Estonia

<b>Results</b>			
<b>Emissions before</b>	<b>273 t CO<sub>2</sub>/day</b>		
	<b>99,694 t CO<sub>2</sub>/year</b>		
<b>Emissions after</b>	<b>Scenario 1</b>	<b>Scenario 2</b>	<b>Scenario 3</b>
	<b>240 CO<sub>2</sub>/day</b>	<b>235</b>	<b>229</b>
	<b>87,608 CO<sub>2</sub>/year</b>	<b>85,894</b>	<b>83,631</b>
<b>Reduction t CO<sub>2</sub> per day</b>	<b>33</b>	<b>38</b>	<b>44</b>
<b>Per year</b>	<b>12,086</b>	<b>13,799</b>	<b>16,063</b>
<b>By 2020 (7 years)</b>	<b>84,601</b>	<b>96,596</b>	<b>112,438</b>

# Conclusions

- Climate change argument for cycling promotion makes sense intuitively but data is missing
- For cities, best arguments are local benefits:
  - Health benefits for users
  - Cleaner air
  - Quieter, safer streets
  - More vibrant street life and commerce

# Thanks for your attention!
