

Climate Action Progress Report 2024 country profile

BULGARIA

This country profile supports and complement the assessments of the Climate Action Progress Report 2024. It is based on data reported by the EU Member States. It does not replace formal progress assessments.

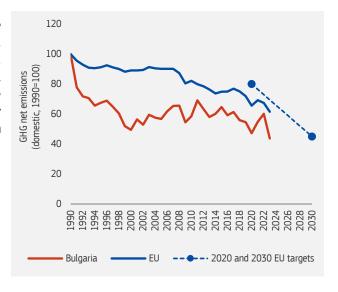

January 2025

1. Key highlights

- In 2023, GHG emissions in Bulgaria were 45.1 MtCO2-eq, 22.9% lower compared to 2022.
- Net GHG emissions (i.e. including LULUCF) in 2023 were 56% lower than 1990 levels.
- Emissions covered by the Effort Sharing Regulation decreased by 4.5% compared to 2022
- 57% of Recovery and Resilience funds and 37% of Cohesion funds are allocated to climate action.

2. Greenhouse gas emissions

In 2023, approximated domestic greenhouse gas (GHG) emissions in Bulgaria were 45.1 MtCO2-eq, 22.9% lower compared to 2022 and 16.5% below pre-pandemic levels. Overall, net domestic emissions, including the Land Use, Land Use Change and Forestry (LULUCF) sector, were 56.3% lower than 1990 levels.

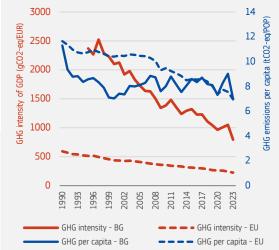

Total domestic GHG emissions								
	MtCO₂-eq	% change	% average annual change					
	1990	1990-2023	1990-2005 2005-2022 2022-2023					
Bulgaria	99	-54%	-3.0%	-0.4%	-22.9%			
EU	4 867	-36%	-0.5%	-1.7%	-7.6%			

Total net domestic GHG emissions (including LULUCF)							
Bulgaria	81	-56%	-3.7%	0.3%	-27.4%		
EU	4 650	-38%	-0.7%	-1.7%	-8.8%		

[▲] Note: GHG emissions and removals for 1990-2022 are based on data submitted by EU Member States to the UNFCCC under Regulation (EU) No 525/2013. GHG emissions for 2023 are based on approximated GHG inventories.

In 2023, net GHG emissions per capita in Bulgaria were 7.0 tonnes of CO2 equivalent, above the EU average of 6.9 tCO2-eq. In the same year, the GHG intensity of GDP (i.e. net GHG emissions over GDP) was 795 gCO2-eq/EUR, above the EU average of 225 gCO2-eq/EUR. Bulgaria has the highest GHG intensity of GDP in the EU.

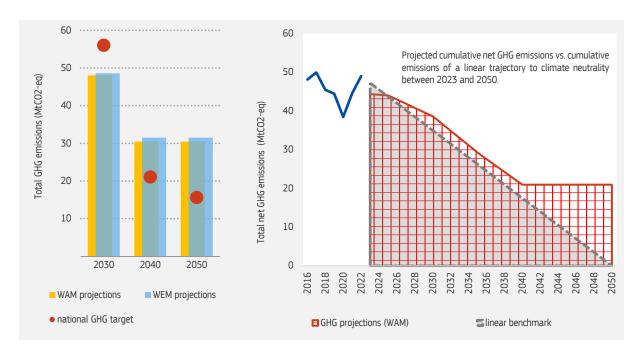

In 2024, Bulgaria did not update GHG projections. Under the existing policy scenario (WEM) they point to a reduction in net GHG emissions (including LULUCF) of 51% and 72% by 2030 and 2050, respectively, compared to 1990. With additional measures (WAM), projected reductions are 53% and 74% for the same respective years.

By comparing the cumulative projected net GHG emissions between 2023 and 2050 with a linear trajectory to climate neutrality by 2050, Bulgaria shows an overshoot of 26% (i.e. cumulative projected emissions are higher than those from a linear trajectory).

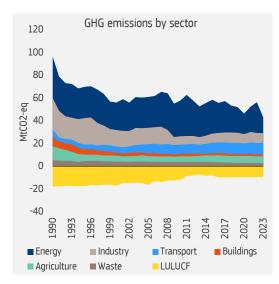

▲ Note: Note: (1) GHG emission projections as updated by 11 Member States in March 2024. (2) WEM = with existing measures; WAM = with existing and additional measures. (3) The national GHG targets are from Member States' submissions of NECP progress reports (Annex I, Table 1). Missing data are replaced by other available reported information. (4) The overshoot metric compares cumulative projected net GHG emissions under the WAM scenario (including LULUCF) with cumulative emissions underlying a linear trajectory from 2021 emissions levels to zero by 2050.

3. Greenhouse gas emissions by sector

	1990- 2023 % change	1990- 2005	2005- 2022 erage annual c	2022- 2023	EU 2022- 2023
Energy	-62.2%	-2.0%	0.0%	-48.9%	-19.8%
Industry	-70%	-4.2%	-2.8%	-6.0%	-5.5%
Transport	58.9%	1.2%	1.4%	4.1%	-0.8%
Buildings	-80%	-7.5%	-2.6%	0.0%	-5.6%
Agriculture	-51.9%	-5.9%	1.1%	0.0%	-2.0%
Waste	-47%	-2.0%	-1.9%	0.0%	-1.3%
LULUCF	(absolute change)		(absolute a	nnual change)	
	8.2	0.1	0.4	0.0	-20
International aviation	-17%	-2.1%	0.8%	0.2%	9.8%

▲ Notes: (1) Energy sector refers to electricity and heat production and petroleum refining. (2) Industry includes fuel combustion in manufacturing and construction and emissions in industrial processes and product use. (3) Buildings includes emissions from energy use in residential and tertiary buildings, and energy use in agriculture and fishery sectors. (4) For LULUCF, the table reports differences between the given years in absolute values (MtCO2-eq). Negative values indicate a reduction of net emissions or an increase in net removals.

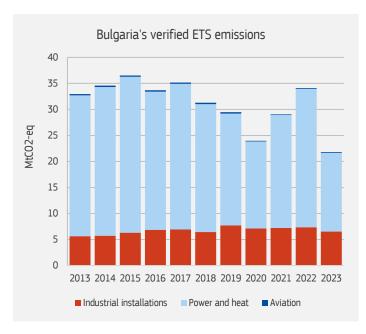

In 2023, the highest contribution to GHG emissions in Bulgaria came from the Energy sector (41%), followed by the Transport sector (30%) and the LULUCF sector (-28%). Between 2005 and 2023, the sectors which contributed the most to the change in net GHG emissions (i.e. -25%) were Energy, for which emissions fell by 49%, and LULUCF, where net removals increased by 6.7 Mt CO2 eq.).

4. Emissions under the EU Emissions Trading System (ETS)

The EU ETS is an EU-wide market instrument to provide an incentive for emission reductions and transformative investments in the covered sectors. This means that it is largely the market that determines where in the EU the emission reductions take place, outside the control of Member States. However, Member States may adopt complementary (sectoral) policies in addition to the ETS's carbon price signal.

In 2023, stationary installations (93 power generation and manufacturing industries) in Bulgaria emitted 21.6 MtCO2-eq (equal to 37% of total GHG emissions in Bulgaria). This was 36.2% lower compared to 2022 and 26% below pre-pandemic levels. By 2023, emissions from stationary installations were down by 34% against the 2013 level (i.e. -43% to the 2005 level). Aviation emissions covered by the EU ETS were 2.7% lower compared to 2022 and 41.2% below the 2020 level.

▲ (**) ETS emissions from aviation include flights within the European Economic Area (EEA) and outgoing flights to Switzerland and to the UK.

In parallel, Bulgaria has raised over EUR 4.78 billion in auction revenues since 2013 (EUR 1172 million in 2023), available for further climate action and energy transformation. Bulgaria reported that an average of 100% of revenues was spent for climate and energy purposes over the same period.(*)

▲ (*) Almost all 2023 revenue is disbursed to the Ministry of Energy's Fund for Security of the Electric Power System (FSES) that compensates non-domestic end-users for the rise in electricity prices (EUR 1,167.6 million).

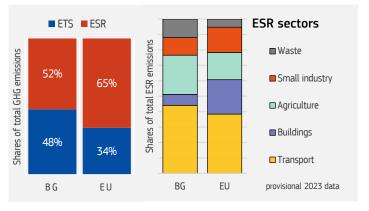

Verified ETS emissions (<i>MtCO₂-eq</i>)							
	2013	2022	2023				
Power installations	27.1	26.6	15.1				
% change since 2013	-	-1.8%	-44.2%				
Industrial installations	5.6	7.4	6.5				
% change since 2013	-	30.9%	16.0%				
Aviation (**)	0.25	0.17	0.16				
% change since 2013	-	-33.6%	-35.3%				

5. Emissions in Effort Sharing sectors

In 2023, approximated emissions under the Effort Sharing Regulation (ESR), which excludes ETS and LULUCF emissions and removals, were 52% of total emissions in Bulgaria compared to 65% for the EU.

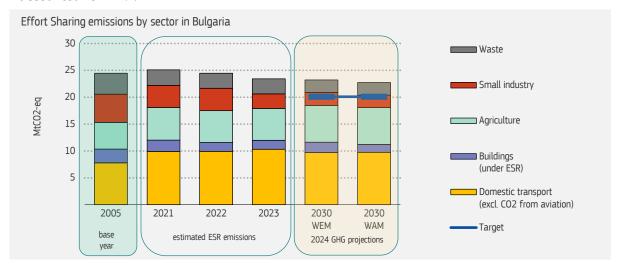

In 2023, effort sharing approximated emissions in Bulgaria were 24.5 MtCO2eq, 4.5% lower than in 2022 and 9.3% below the pre-pandemic level.

▲ Notes: (1) Small industry includes emissions from energy industries, manufacturing and construction, and industrial processes, that do not fall under the EU Emission Trading System. (2) Transport includes emissions from domestic transport activities, excluding CO2 emissions from aviation. (3) Buildings includes emissions for heating buildings under the FSR

In 2023, the largest contribution to the absolute change in ESR emissions came from small industry, for which emissions decreased by 35.1%, and transport, with emissions increasing by 4.1% compared to 2022.

In 2023, small industry accounted for 11% of total ESR emissions in Bulgaria, and transport accounted for 44%.

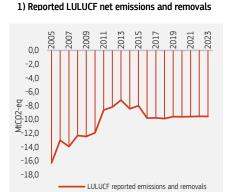

▲ Note: (1) 2023 ESR emissions are based on approximated inventory reports and the European Environment Agency (EEA)'s calculation of ESR emissions. The approximated emissions can, therefore, deviate from Member States' reported emissions. (2) Projections as reported by Member States under Reg. (EU) 2018/1999, compiled and checked by the EEA. (3) WEM = with existing measures, WAM = with existing and additional measures.

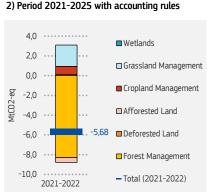

The Effort Sharing Regulation (ESR) sets the 2030 ESR emission reduction target for Bulgaria to 10%, compared to 2005 levels. In 2024, Bulgaria did not update GHG projections. Latest GHG projections submitted by Bulgaria under the existing measures scenario (WEM) point to a 4% increase in ESR emissions by 2030 compared to 2005 levels, less ambitious than its ESR emission reduction target by 14 percentage points. Considering the impact of additional measures (WAM), projected ESR emissions point to a 2% increase, less ambitious than its ESR emission reduction target by 12 percentage points.

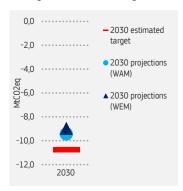

6. Land Use, Land Use Change and Forestry (LULUCF)

Based on final inventory data, in 2022, Bulgaria reported net removals of 9.54 MtCO2-eq in the land use, land use change, and forestry sector (LULUCF). Based on approximated data, in 2023, net removals from the LULUCF sector were 9.56 MtCO2-eq.

3) Progress towards 2030 target

▲ Notes: (1) Figure 1 shows net reported emissions and removals for the LULUCF sector. Net removals are expressed as negative numbers and net emissions as positive numbers. (2) Figure 2 shows the accounted emissions and removals for the LULUCF sector in 2021 and 2022. Computation of the accounts per land use category, applying the standardised rules in the LULUCF Regulation EU) 2018/841. The input data for this analysis have been extracted from the EU Greenhouse Gas Inventory Report 2024 for 1990-2022 based on final Member States' inventory submissions under the EU Governance Regulation (EU) 2018/1999. (3) Figure 3 shows projected progress with existing measures (WEM) and with additional measures (WAM) in relation to the national 2030 target. The LULUCF Regulation sets out binding national 2030 targets for each Member State encompassing all emissions and removals in the LULUCF sector (Art. 4.3). The targets are specified in Annex IIa of the LULUCF Regulation. Individual targets are derived from the EU-wide target of -310 MtCO2-eq net removals by 2030, Member States' average historic net removals from their GHG inventories for the years 2016, 2017 and 2018 and the countries' share of total EU managed land area.

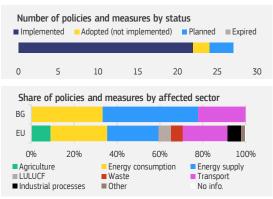

With current LULUCF accounting rules – with a limited scope – applicable to the period 2021 to 2025, the provisional 'accounted' balance for 2021 and 2022 using the 2024 GHG inventory submission produced an accounted credit of 5.7 MtCO2-eq.

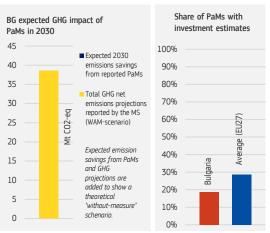

Forest Management and Grassland Management were the dominating land activities, with accounted net removals of 8.3 and accounted net emissions of 2.2 MtCO2-eq, respectively.

Latest LULUCF projections for Bulgaria show net removals in 2030 of 9.0 MtCO2-eq with existing measures (WEM) and 9.5 MtCO2-eq with additional measures (WAM), leaving a gap of around 1.3 MtCO2-eq to the estimated 2030 net removal target of 10.8 MtCO2-eq.

7. Policies and measures

This section uses data reported every two years by EU Member States on their national greenhouse gas policies and measures (Article 18 of the Governance of the Energy Union and Climate Action Regulation). The EEA performs specific quality checks on the submissions by Member States to ensure the accuracy of the reported information on policies and measures. Nonetheless, the analysis suffers from the lack of completeness of reported data.

In 2023, Bulgaria reported 27 single policies and measures (PaMs), representing a decrease of -41% compared to 2021. As of 2023, none of the reported PaMs are planned but not yet implemented.

Ex-ante emissions savings

Bulgaria did not estimate an expected emission reduction effect for any of its single or group PaMs.

Investments needs

Bulgaria estimates the investment need for 19% of its single and group PaMs. It estimates the initial investment requirement at EUR 11100 ml. Actual investments up to and including 2021 amount to EUR 6300 ml., with EUR 4300 ml. remaining to be implemented at this date.

More information and visualisations are available at the EEA <u>integrated national energy and climate</u> policies and measures data viewer.

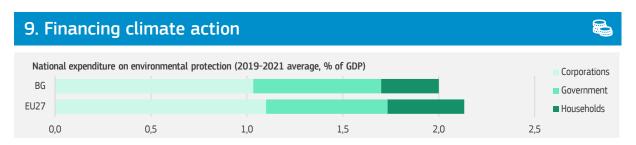

8. Climate-neutrality dashboard

	GHG intensity of GDP (2023)	Projected net GHG emissions by 2030 (tonnes CO2eq per capita)	ESR target vs MS projections (to 2005 level, ppt, "-" = gap)	LULUCF target vs MS projections (tCO2eq/km2 of land, "-" = gap)	Share of gross final consumption of energy from renewable sources	Projected net GHG emissions by 2050 (tonnes CO2eq per capita)	Overshoot vs. non- linear benchmark (2023-2050)	Target year for climate neutrality (officially reported or "other sources))	Legal status of the climate- neutrality target (based on the Net- Zero Tracker)
Bulgaria	627	5.9	-12.1	-3	19%	3.6	66%	2050*	Declaration / pledge
EU27	206	5.0	-6.5	-22	23%	3.3	39%	2050	In law
Changes compared to the 2023 edition									
Bulgaria		1	1	1	1	1	Į.		whether the indicator worsened compared to
EU27						Ì		the 2023 edition	of the dashboard and iitude of the change.

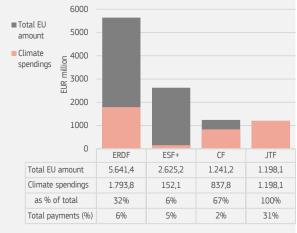

↑ The table above represents an extract of the Climate Neutrality Dashboard as reported in the staff working document accompanying the Climate Action Progress Reports 2024. (1) GHG intensity of GDP (gCO2-eq/EUR2015) uses net GHG emissions (i.e. including LULUCF and excluding international aviation). Real GDP and population data from Eurostat. (2) GHG emission projections as submitted in 2023 (or updated in 2024) by Member States under Art. 18 of the Governance Regulation considering additional measures (WAM). EU Population in 2050 is based on the latest Eurostat population projections. Agriculture and forest land are based on the Eurostat land use statistics. (3) The overshoot against a non-linear indicative benchmark compares the cumulative projected GHG emissions (excluding LULUCF) with an indicative pathway to climate neutrality based on the scenarios proposed by the European Scientific Advisory Board on Climate Change, and then distributed across Member States according to the country's share of EU emissions in the core policy scenario supporting the initiatives delivering the European Green Deal. Projections consider, where available, the impact of both existing and additional policies and measures. (4) Target dates to achieve climate neutrality as in the NECP progress reports or, with an asterisk "*", when from other unofficial sources (Net–Zero Tracker: https://zerotracker.net/).

Climate	-Neutrality	Levers	The Climate-Neutrality Dashboard now includes a set of seven	
	EU27	BG	change compared to 2023 for BG	new complementary indicators, or levers, to put some light into the level of GHG emissions in Member States:
Zero-Emission Energy	55%	48%	•	Share of RES and nuclear in gross electricity and heat production
Greening Industry	43%	38%	•	Share of RES and electricity in FEC in manufacturing and construction
Sustainable mobility	130	146	•	Average CO ₂ emissions of new cars sold
Energy efficient buildings	3.9	2.9	•	FEC in buildings, gOE per m ² *HDD and CDD
Waste prevention	511	427	•	Municipal waste generation per capita, kg

This country profile supports and complement the assessments of the Climate Action Progress Report 2024. It is based on data reported by the EU Member States. It does not replace formal progress assessments.

Every year, the European Commission publishes the EU Climate Action Progress Report: an annual report on progress towards the EU's emission reduction targets. The report covers actual (historic) emissions and projected future emissions for the EU as a whole and for every EU Member State. It also includes information on different climate policy areas, EU legislative progress, climate finance and adaptation.

With the annual report, the Commission delivers on obligations set out in the <u>Governance</u> <u>Regulation</u>, including to assess progress with the EU 2030 climate target.

You can see latest EU Climate Action Progress Report here: <u>Implementation for a clean and</u> competitive EU economy

"The EU is leading the way in the clean transition, with another year of strong greenhouse gas emission reductions in 2023. The EU now represents 6% of global emissions. At COP29, we once again demonstrated to our international partners that it is possible to take climate action and invest in growing our economy at the same time. Sadly, the report also shows that our work must continue, at home and abroad, as we are seeing the harm that climate change is causing our citizens."
