1. Total greenhouse gas emissions

Figure 1: Left hand side: Total greenhouse gas emissions (incl. international aviation) 1990-2019 (index 1990 = 100%). Right hand side: Greenhouse gas emissions by sector – historical emissions 1990-2018, proxy 2019, projections WEM 2020-2030 (Mt CO₂-eq).

2. ETS emissions

Figure 3: ETS emissions 2007-2019 (Mt CO₂-eq).³

---

² Excluding international aviation, CO₂ from domestic aviation and NF3.
³ The scope of ETS was extended from 2013. To reflect the current scope of ETS, estimates made by EEA are included in the figures from 2005 to 2012. The estimates cover only emissions from stationary installations.
3. Emissions in Effort Sharing sectors

![Graph showing emissions and targets under the Effort Sharing Decision/ Effort Sharing Regulation 2019, 2020 and 2030 as percentage change from 2005.]

![Graph showing emissions, annual emission allocations (AEAs) and accumulated surplus/deficit of AEAs under the Effort Sharing Decision 2013-2019 (Mt CO₂-equivalents).]

Figure 4: Left hand side: Emissions and targets under the Effort Sharing Decision/ Effort Sharing Regulation 2019, 2020 and 2030 as percentage change from 2005. Right hand side: Emissions, annual emission allocations (AEAs) and accumulated surplus/deficit of AEAs under the Effort Sharing Decision 2013-2019 (Mt CO₂-equivalents).
4. Land use, land use change and forestry

Reported quantities under the Kyoto Protocol for Hungary show net removals of, on average, -4.2 Mt CO₂-eq for the period 2013 to 2018. In this regard, Hungary contributes with 1.1% to the annual average sink of -396.7 Mt CO₂-eq of the EU-27. Accounting for the same period depicts net credits of, on average, -3.2 Mt CO₂-eq, which corresponds to 2.8% of the EU-27 accounted sink of -114.1 Mt CO₂-eq.

Reported net removals and accounted net credits show a strongly fluctuating pattern with a small increase over the six-year period.

The dominating reported activity is Forest Management with removals followed by moderate removals by Afforestation/Reforestation and small emissions by Deforestation. Removals by Forest Management show a remarkable variability with no clear trend over the course of the six-year period. Emissions by Deforestation are increasing.

Credits by Forest Management are generally the dominating accounting activity over the six-year period. Credits by Afforestation/Reforestation are sizable; in fact, they are the biggest quantity in 2013. Debts by Deforestation represent only a small fraction of the total accounted quantities. Major fluctuations with an overall increase of removals by Forest Management dominate the dynamics. Small increases in debits by Deforestation play a minor role.

---

4 The differences between reported and accounted emissions from LULUCF under the Kyoto Protocol are described in the ‘explanatory note on LULUCF – accounted and reported quantities under the Kyoto Protocol’.
