1. Total greenhouse gas emissions

Figure 1: Left hand side: Total greenhouse gas emissions (incl. international aviation) 1990-2019 (index 1990 = 100 %). Right hand side: Greenhouse gas emissions by sector\(^1\) – historical emissions 1990-2018, proxy 2019, projections WEM 2020-2030 (Mt CO\(_2\)-eq).

\(^1\) The sectors in the figure correspond to the following IPCC sectors: Energy supply: 1A1, 1B and 1C. Energy use in manufacturing industries: 1A2. Industrial processes and product use: 2. Transport: 1A3. Other energy use: 1A4, 1A5 and 6. Agriculture: 3. Waste: 5. International aviation: memo item.
2. ETS emissions

---

2 Excluding international aviation, CO₂ from domestic aviation and NF.
3 The scope of ETS was extended from 2013. To reflect the current scope of ETS, estimates made by EEA are included in the figures from 2005 to 2012. The estimates cover only emissions from stationary installations.
3. Emissions in Effort Sharing sectors

Figure 4: Left hand side: Emissions and targets under the Effort Sharing Decision/ Effort Sharing Regulation 2019, 2020 and 2030 as percentage change from 2005. Right hand side: Emissions, annual emission allocations (AEAs) and accumulated surplus/ deficit of AEAs under the Effort Sharing Decision 2013-2019 (Mt CO$_2$-eq).
4. Land use, land use change and forestry

Reported quantities under the Kyoto Protocol for Poland show net removals of, on average, -38.8 Mt CO₂-eq for the period 2013 to 2018. In this regard, Poland contributes with 9.8% to the annual average sink of -396.7 Mt CO₂-eq of the EU-27. Accounting for the same period depicts net credits of, on average, -11.7 Mt CO₂-eq, which corresponds to 10.2% of the EU-27 accounted sink of -114.1 Mt CO₂-eq.

Reported net removals and accounted net credits decrease between 2013 and 2015, increased in 2017 and show stable levels thereafter.

The dominating reported activity is Forest Management with removals. Removals by Afforestation/Reforestation are small and emission by Deforestation negligible except for 2016 with emissions of 6.8 Mt CO₂-eq. This increase is the result from large conversions of forest to settlement for expanding infrastructures required to support the growing population rates. Removals by Forest Management decrease between 2013 and 2015 by 11.1 Mt CO₂-eq, followed by a moderate increase in 2016 and thereafter remain at this level. The decreasing removals from 2013 to 2015 relates to a reported increase in harvests.

Credits by Forest Management are the biggest accounting quantity. Credits by Afforestation/Reforestation are moderate, and debits by Deforestation negligible except for 2016. Debits by Forest Management decreased from 2013 to 2015, increased in 2017 and remained at this level thereafter.

---

*The differences between reported and accounted emissions from LULUCF under the Kyoto Protocol are described in the ‘explanatory note on LULUCF – accounted and reported quantities under the Kyoto Protocol’.*
